J2945™/1

MAR2016

Issued

2016-03

## On-Board System Requirements for V2V Safety Communications

### RATIONALE

This standard is the first edition of on-board system requirements for V2V safety communications. It provides the information necessary to build interoperable systems that support select safety applications, which rely on the exchange of Basic Safety Messages.

### TABLE OF CONTENTS

1.	SCOPE .....	4
1.1	Purpose .....	4
2.	REFERENCES.....	5
2.1	Applicable Documents .....	5
2.2	Related Publications .....	5
3.	TERMS AND DEFINITIONS .....	6
3.1	DEFINITIONS .....	6
3.2	ABBREVIATIONS AND ACRONYMS.....	7
3.3	Requirement Numbering Convention.....	10
4.	V2V SAFETY SYSTEMS CONCEPT OF OPERATIONS AND SYSTEM DESCRIPTION .....	11
4.1	V2V System Overview .....	11
4.2	V2V Safety Features .....	13
4.2.1	Critical Crash Scenarios for V2V Safety .....	13
4.2.2	Mapping Between Critical Crash Scenarios and the Selection of V2V Safety Applications.....	13
4.2.3	Emergency Electronic Brake Lights (EEBL) .....	14
4.2.4	Forward Crash Warning (FCW) .....	15
4.2.5	Blind Spot Warning/Lane Change Warning (BSW/LCW) .....	18
4.2.6	Intersection Movement Assist (IMA) .....	21
4.2.7	Left Turn Assist (LTA) .....	23
4.2.8	Control Loss Warning (CLW) .....	25
5.	INTERFACE DESCRIPTION .....	27
5.1	V2V Over-the-Air Data Description .....	27
5.1.1	Basic Safety Message Exchange .....	27
5.1.2	Positioning.....	27
5.1.3	Security and Privacy .....	28
5.1.4	Startup and Shutdown.....	28

SAE Technical Standards Board Rules provide that: "This report is published by SAE to advance the state of technical and engineering sciences. The use of this report is entirely voluntary, and its applicability and suitability for any particular use, including any patent infringement arising therefrom, is the sole responsibility of the user."

SAE reviews each technical report at least every five years at which time it may be revised, reaffirmed, stabilized, or cancelled. SAE invites your written comments and suggestions.

## 1. SCOPE

This standard specifies the system requirements for an on-board vehicle-to-vehicle (V2V) safety communications system for light vehicles<sup>1</sup>, including standards profiles, functional requirements, and performance requirements. The system is capable of transmitting and receiving the Society of Automotive Engineers (SAE) J2735-defined Basic Safety Message (BSM) [1] over a Dedicated Short Range Communications (DSRC) wireless communications link as defined in the Institute of Electrical and Electronics Engineers (IEEE) 1609 suite and IEEE 802.11 standards [2] – [6].

### 1.1 Purpose

This standard addresses the on-board system needs for ensuring that the exchange of BSMs in V2V safety communications provides the desired interoperability and data integrity to support the performance of the envisioned safety applications.

---

<sup>1</sup> Refer to section 3.1 for the definition of light vehicle. Other vehicle classes and trailers will be addressed in future revisions of this standard, or in other standards within the SAE J2945 family of standards. These revisions or additional standards are expected to be compatible with the requirements of this standard and may define additional capabilities beyond the requirements for light vehicles.

### 3. TERMS AND DEFINITIONS

#### 3.1 DEFINITIONS

For the purposes of this standard, the following definitions apply.

##### 3.1.1 Crash

A collision between two or more vehicles.

##### 3.1.2 Critical Event Flag

The Hard Braking, ABS, Traction Control, and Stability Control event flags within DE\_VehicleEventFlags.

##### 3.1.3 Critical Event Condition

When an event that corresponds to a Critical Event Flag occurs.

##### 3.1.4 Hard Braking

A vehicle is decelerating at a level greater than 0.4g.

##### 3.1.5 Latency

The delay from an event occurrence to the desired outcome.

### 3.1.6 Light Vehicle

A class 2 or class 3 vehicle as defined by FHWA ([http://onlinemanuals.txdot.gov/txdotmanuals/tri/vehicle\\_classification\\_using\\_fhwa\\_13category\\_scheme.htm](http://onlinemanuals.txdot.gov/txdotmanuals/tri/vehicle_classification_using_fhwa_13category_scheme.htm)), excluding ambulances, law enforcement vehicles, fire department vehicles and construction vehicles.

### 3.1.7 Packet Collision

When two or more transmissions overlap in time at a potential receiver, causing the receiver to fail to interpret the content of any of the transmissions.

### 3.1.8 Security Credential Management System

The public key infrastructure that issues certificates and manages other security functions.

## 3.2 ABBREVIATIONS AND ACRONYMS

The abbreviations and acronyms cited below are terms used in this Standard.

ABS	Antilock Brake System
ACR	Adjacent Channel Rejection
AES	Advanced Encryption Standard
ASN.1	Abstract Syntax Notation One
BSM	Basic Safety Message
BSS	Basic Service Set
BSW	Blind Spot Warning
CA	Certificate Authority
CAMP	Crash Avoidance Metrics Partnership
CAN	Controller Area Network
CBP	Channel Busy Percentage
CCH	Control Channel
CCM	Counter Mode with Cipher Block Chaining Message Authentication Code
CFR	Code of Federal Regulations
CLW	Control Loss Warning
CME	Certificate Management Entity
CPR	Certificate Provisioning Request
CRL	Certificate Revocation List
CRLG	Certificate Revocation List Generator
DCM	Device Configuration Manager
DE	Data Element
DF	Data Frame
DNS	Domain Name Services
DOT	Department of Transportation
DSRC	Dedicated Short Range Communications
DTI	Distance to Intersection
DVI	Driver Vehicle Interface
ECDSA	Elliptic Curve Digital Signature Algorithm
ECIES	Elliptic Curve Integrated Encryption Scheme
ECU	Electronic Control Unit

EDCA	Enhanced Distributed Channel Access
EEBL	Emergency Electronic Brake Lights
EGNOS	European Geostationary Navigation Overlay Service
FCC	Federal Communications Commission
FCW	Forward Crash Warning
FHWA	Federal Highway Administration
FIPS	Federal Information Processing Standards
GHz	Gigahertz
GNSS	Global Navigation Satellite System
HCF	Hybrid Coordination Function
HSM	Hardware Security Module
<u>HV</u>	<u>Host Vehicle</u>
Hz	Hertz
ICA	Intermediate Certificate Authority
IEEE	Institute of Electrical and Electronics Engineers
IMA	Intersection Movement Assist
IPv6	Internet Protocol Version 6
ITT	Inter-transmit Time
kph	Kilometers per hour
LCW	Lane Change Warning
LOS	Line of Sight
LTA	Left Turn Assist
MA	Misbehavior Authority
MAC	Medium Access Control
MD	Model Deployment
MHz	Megahertz
MIB	Management Information Base
MLME	MAC Sublayer Management Entity
MPR	Minimum Performance Requirements
NHTSA	National Highway Traffic Safety Administration
NMEA	National Marine Electronics Association
OBE	Onboard Equipment
OCB	Outside the Context of a BSS
OFDM	Orthogonal Frequency Division Multiplexing
OTA	Over the Air
PCA	Pseudonym Certificate Authority
PER	Packet Error Ratio
PH	Path History
PHY	Physical Layer
PICS	Protocol Implementation Conformance Statement
PLME	Physical Layer Management Entity
PP	Path Prediction
PPS	Pulse Per Second
PSDU	Physical Layer Convergence Procedure Service Data Unit

PSID	Provider Service ID
QPSK	Quadrature Phase Shift Keying
RA	Registration Authority
RF	Radio Frequency
RSE	Roadside Equipment
RP	Radiated Power
<u>RV</u>	<u>Remote Vehicle</u>
SAE	Society of Automotive Engineers
SAP	Service Access Point
SBAS	Satellite Based Augmentation System
SCH	Service Channel
SCMS	Security Credential Management System
SDEE	Secure Data Exchange Entity
STA	Station
3D	Three-Dimensional
TSF	Time Synchronization Function
TTC	Time-to-Collision <sup>2</sup>
TTI	Time-to-Intersection
Tx	Transmit
UPER	Unaligned Packed Encoding Rules
URL	Uniform Resource Locator
UTC	Universal Coordinated Time
V2V	Vehicle-to-Vehicle
V2V-SE	Vehicle-to-Vehicle Systems Engineering and Vehicle Integration Research for Deployment (Project)
VOD	Verify on Demand
VSA	Vendor Specific Action
VSC-A	Vehicle Safety Communication - Applications
VSC 3	Vehicle Safety Communications 3 (Consortium)
WAAS	Wide Area Augmentation System
WAVE	Wireless Access in Vehicular Environments
WGS	World Geodetic System
WME	WAVE Management Entity
WSM	WAVE Short Message
WSA	WAVE Service Advertisement
WSMP	WAVE Short Message Protocol

---

<sup>2</sup> The TTC acronym uses collision instead of crash to be consistent with other industry work.

### 3.3 Requirement Numbering Convention

Each requirement in this standard is tagged with a requirement number of the form:

<Subsection Number>-V2V-< Category Abbreviation>-<Subcategory Abbreviation>-<Number>

For example, if the requirement number is 6.5.2-V2V-SECPRIV-BSMSIGN-005, the subsection is 6.5.2, the category is Security and Privacy, the subcategory is BSM signing, and it is requirement number 5 in the subcategory. Table 1 identifies the Sections in this standard and the corresponding subsections and abbreviations that are used. The abbreviation is also in parentheses following each Section heading in this standard. The requirement numbering convention applies to both mandatory and optional features.

**Table 1 - Requirement numbering abbreviations**

Section	Subsection	Category	Category Abbreviation	Subcategory	Subcategory Abbreviation
6.1	6.1.1	Standards Profiles	STD	IEEE 802.11	802.11
	6.1.2			IEEE 1609.2	1609.2
	6.1.3			IEEE 1609.3	1609.3
	0			IEEE 1609.4	1609.4
	6.1.5			IEEE 1609.12	1609.12
	6.1.6			SAE J2735	SAE J2735
0	6.2.1	Positioning and Timing	POSTIM	Position Determination	POSDETER
	6.2.2			Wide Area Augmentation System	WAAS
	6.2.3			Coordinate System and Reference	COORDSYSREF
	6.2.4			System Time Coordination	SYSTIMCOORD
6.3	6.3.1	BSM Transmission	BSMTX	BSM Contents	BSMCONT
	6.3.2			Channel and Data Rate	CHDATARATE
	6.3.3			First BSM after Startup and Generation Timing	GENTIM
	0			User Priority and EDCA Settings	UPEDCA
	6.3.5			Minimum Transmission Criteria	MINTX
	6.3.6			Data Element Accuracy	DATAACC
	6.3.7			Data Persistency	DATAPERSIST
	6.3.8			BSM Scheduling and Congestion Control	CONGCTRL
6.4	6.4.1	RF Performance	RFPERF	DSRC Transmit Power Accuracy and Radiated Transmit Power	DSRCTX
	6.4.2			DSRC Receive Sensitivity	DSRCRXSENS

***Table 1 - Requirement numbering abbreviations (continued)***

Section	Subsection	Category	Category Abbreviation	Subcategory	Subcategory Abbreviation
6.5	6.5.1	Security and Privacy	SECPRI	ID Randomization	IDRAND
	6.5.2			BSM Signing	BSMSIGN
	6.5.3			Certificate Change	CERTCHG
	6.5.4			BSM Verification	BSMVERIFY
	6.5.5			Certificate Revocation	CERTREV
6.6	6.6.1	Security Management	SECMGMT	Bootstrap: Enrollment and Initialization Processing	ENINIT

	6.6.3			Certificate Storage	CERTSTORE
	6.6.4			CRL Loading	CRLLOAD
	0			Secure Hardware	SECHW

## 4. V2V SAFETY SYSTEMS CONCEPT OF OPERATIONS AND SYSTEM DESCRIPTION

This Section provides a high-level description of the V2V safety concept of operations and system description. Section 4.1 provides an overview of the system, and Section 4.2 provides the system description for V2V safety features.

### 4.1 V2V System Overview

V2V safety communications are designed to exchange basic safety information among vehicles for driver assistance by supporting detection of imminent crash threats and alerting the driver. V2V communications use Dedicated Short Range Communications (DSRC) radios to transmit BSMs that include a subset of the available data frames and elements in SAE J2735 [1]. Onboard safety applications use the information about the host vehicle (HV) and remote vehicles (RVs) to detect potential crash threats and alert the driver. Messages can be used for additional purposes, but only the scenarios described herein were used to develop this Standard. For the purposes of the crash scenarios described herein, the HV and RV terminology is used to identify which vehicle is receiving and acting on BSMs (HV), and the set of vehicles from which BSMs are being received (RVs).

V2V communications can enable improved safety system effectiveness by complementing or providing an alternative to self-contained sensors such as radar, lidar, or camera systems. V2V communications provide the vehicle and driver with 360-degree awareness and can detect potential threats at a greater distance than other types of sensors, as well as detecting potential threats to some degree even under non-line-of-sight or low visibility conditions. This enables the driver to receive alerts earlier and have more time to take action to avoid crashes.

Because vehicles need to trust messages from each other, security is essential to protect messages from attacks such as spoofing, alteration, or replay that could cause false alerts or suppress true alerts. In addition, driver privacy is protected appropriately, so the system does not disclose identifying information about the driver, or allow for easy tracking. All BSMs are sent with a signature that enables the receiving device to verify the message. Broadcast information that could potentially be used to identify and track drivers is anonymous and randomized, and other system security measures are also incorporated to protect privacy appropriately.

Figure 1 illustrates the components of the V2V system and its interfaces. An infrastructure-based Security Credential Management System (SCMS) is responsible for generating and delivering the security certificates that are used in the message verification process. The SCMS can also revoke certificates that cannot be trusted (e.g., the associated device may have been tampered with or is misbehaving) by placing them on a Certificate Revocation List (CRL) that the SCMS distributes to all systems. Section 6.6 in this standard describes the SCMS interface.

The V2V onboard equipment (OBE), which is the on-board vehicle-to-vehicle (V2V) safety communications system defined in this standard (hereafter referred to as the System), typically consists of multiple subsystem components, which may be discrete or integrated depending on the implementation. Figure 1 illustrates the following subsystems within the system:

- DSRC Radio Subsystem – Transmits and receives BSMs. In this standard a DSRC radio subsystem is assumed to be a single-channel-at-a-time device. The OBE can include one or more DSRC radio subsystems and still comply with this standard.
- Positioning Subsystem – The subsystem that includes a Global Navigation Satellite System (GNSS) receiver and provides vehicle position, heading, speed, and time information. The System may augment and enhance positioning using additional information and components, which are not shown in Figure 1. Examples of these are speed data from the CAN bus, dead reckoning sensors and optical/camera based systems.
- OBE Control Processor Electronic Control Unit (ECU) – Executes software that generates BSMs for transmission according to the requirements in this standard.
- Antennas – Support radio frequency (RF) links for the DSRC radio and GNSS receiver. A second diversity antenna for the DSRC Radio Subsystem is recommended to improve performance. GNSS and DSRC antennas may be integrated (dual band).

Systems communicate amongst themselves using the DSRC Radio Subsystem as an interface. The System (OBE) can interface to a Safety Application ECU that detects threats and issues alerts through a driver-vehicle interface (DVI). The DVI can provide visual, audio, and/or haptic alerts. The OBE can also interface with the vehicle Controller Area Network (CAN) bus to obtain vehicle status information. The safety application ECU, CAN bus and DVI are outside the scope of this standard.

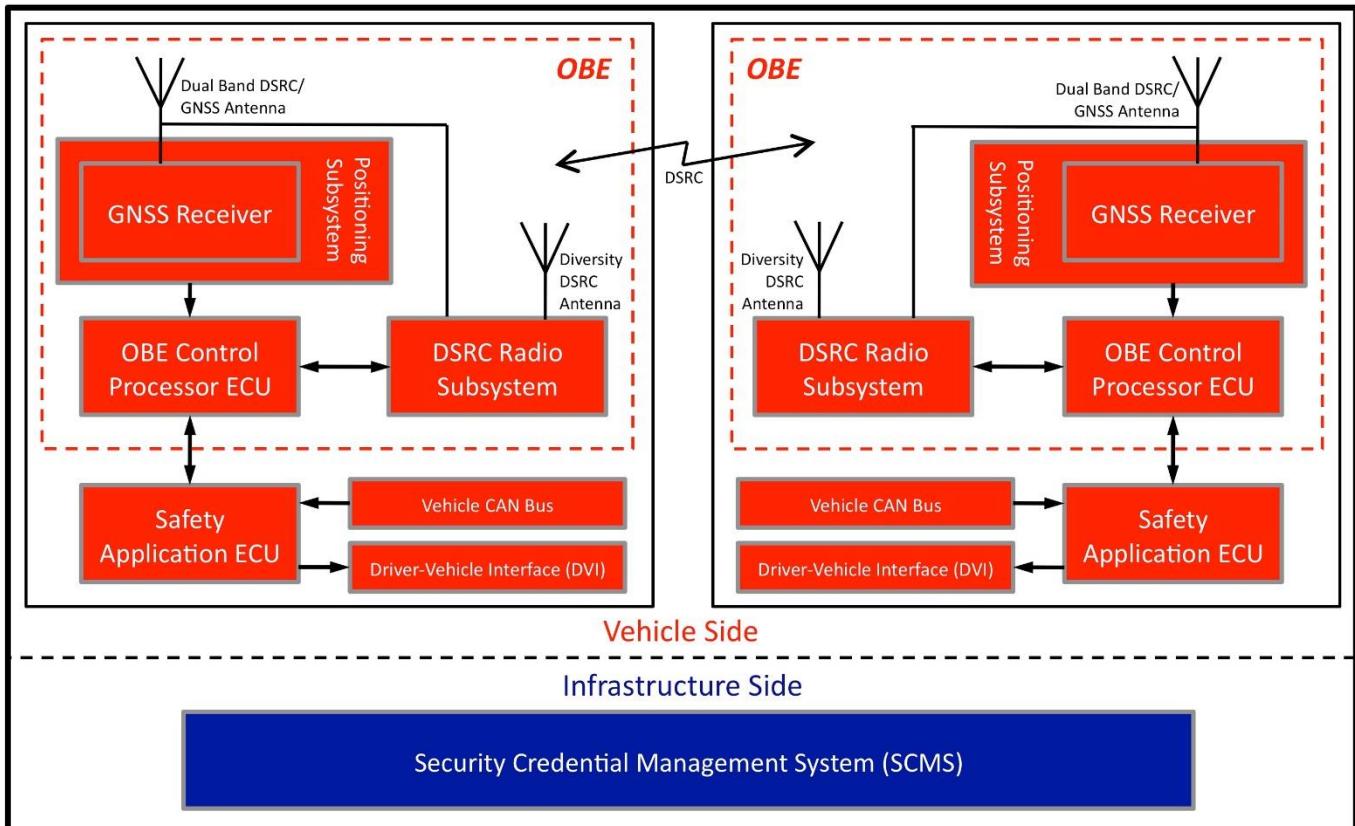

Figure 1 - On board V2V system

## 4.2 V2V Safety Features

### 4.2.1 Critical Crash Scenarios for V2V Safety

The set of crash scenarios that could be addressed by the System were initially analyzed and documented in the Crash Avoidance Metrics Partnership (CAMP) Vehicle Safety Communications-Applications (VSC-A) project 0. Table 2 lists the seven scenarios selected based on a composite ranking of crash frequency, crash cost, and functional years lost<sup>3</sup>. Scenario 7 was subsequently added to address left-turn-across-path intersection crashes during the CAMP VSC 3 driver acceptance clinics project 0.

**Table 2 - Selected crash-imminent scenarios**

Crash Imminent Scenario	Crash Category		
	Frequency	Cost	Functional Years Lost
Lead Vehicle Stopped	✓	✓	✓
Control Loss without Prior Vehicle Action	✓	✓	✓
Vehicle(s) Turning at Non-Signalized Junctions	✓	✓	
Straight Crossing Paths at Non-Signalized Junctions			✓
Lead Vehicle Decelerating	✓	✓	
Vehicle(s) Changing Lanes – Same Direction	✓		
Left Turn Across Path – Opposite Direction			

✓ Denotes Top Five Ranking for the Crash Category

### 4.2.2 Mapping Between Critical Crash Scenarios and the Selection of V2V Safety Applications

In 0 and 0, V2V safety applications were developed to address the selected scenarios. Table 3 illustrates the mapping between the crash-imminent scenarios identified in Table 2 and the list of safety applications. These safety applications are defined and discussed in more detail below. The decision thresholds used to determine when to warn the driver are not specified in this standard and are left to the implementer.

**Table 3 - Crash-imminent scenario to V2V safety application mapping**

Crash Scenarios	Safety Applications	EEBL	FCW	BSW/LCW	IMA	LTA	CLW
Lead Vehicle Stopped		✓					
Control Loss without Prior Vehicle Action							✓
Vehicle(s) Turning at Non-Signalized Junctions					✓	✓	
Straight Crossing Paths at Non-Signalized Junctions					✓		
Lead Vehicle Decelerating	✓	✓					
Vehicle(s) Changing Lanes – Same Direction				✓			
Left Turn Across Path – Opposite Direction						✓	

<sup>3</sup> Functional years lost is a composite measure of crash severity. It measures the loss of an individual's productive time due to injuries sustained in a crash.

#### 4.2.3 Emergency Electronic Brake Lights (EEBL)

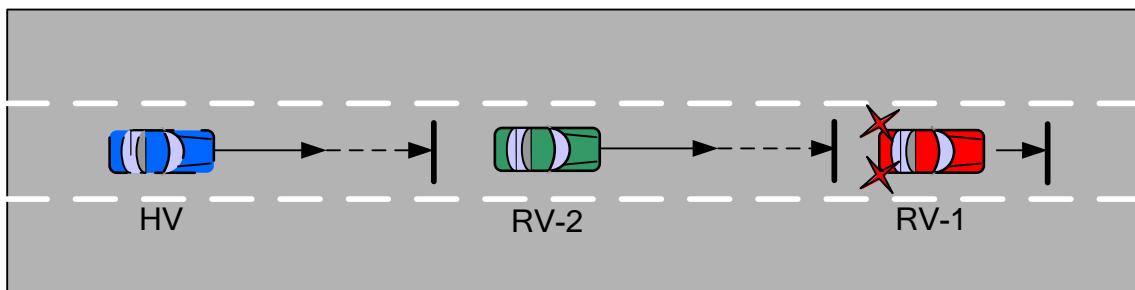

##### 4.2.3.1 Definition

The EEBL safety application warns the driver of the HV in the case of a hard-braking event by an RV that is ahead and in the same lane or an adjacent lane. The RV broadcasts a hard-braking event in the BSM upon a hard braking maneuver. Upon receiving such event information, the HV determines the relevance of the event to its own travel path and provides a warning to the driver, if appropriate.

##### 4.2.3.2 EEBL Use Case Scenario

###### a. EEBL: Abruptly Slowing RV (Figure 2)

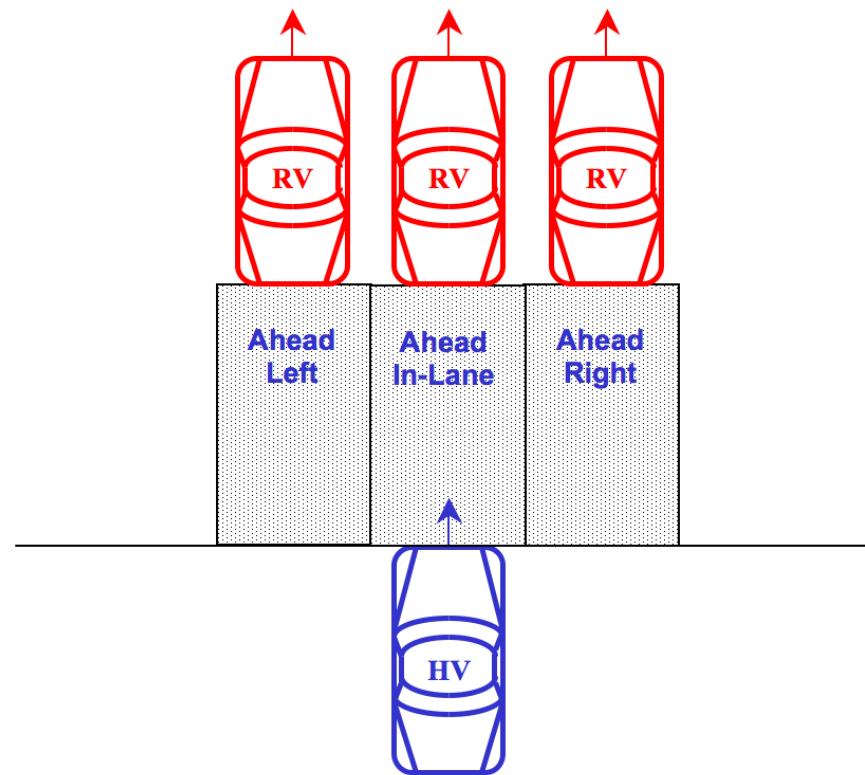

- The HV follows a moving RV-2, which in turn follows RV-1 that abruptly brakes hard. RV-2 may or may not be equipped with V2V communications, but RV-1 is equipped with V2V capability.
- The HV may receive a warning from the EEBL feature when RV-1 applies brakes and decelerates at a level greater than the threshold that corresponds to hard braking (see the definition in 3.1).
- The timing of the warning is expected to be set such that the driver of the HV can avoid a rear-end crash with the vehicle (RV-2) in front.

**Figure 2 - EEBL – abruptly slowing RV**

##### 4.2.3.3 EEBL Feature Systems Description

The EEBL feature warns the driver of the HV in the case of a hard-braking event by an RV that is ahead and in the same lane or in an adjacent lane. The relevant RV zones for the EEBL feature are illustrated in Figure 3. The EEBL feature is expected to function in both straight and curved roadway geometries.

**Figure 3 - Relevant RV zones for the EEBL feature**

EEBL performs the following operations:

- The RV includes a hard-braking event in the broadcasted BSM during a hard-braking maneuver.

Upon receiving such event information, the HV performs the following operations:

- Determines which, if any, RVs have reported a hard-braking event.
- For each RV that has reported a hard-braking event and is classified as “ahead in-lane,” “ahead left,” or “ahead right,” determines if the distance between the vehicles is less than an implementation-specific threshold value.
- Calculates the EEBL threat levels among all RVs identified above, determines the principal threat, and sets the appropriate threat status.
- Provides a warning to the driver via a DVI.

#### 4.2.4 Forward Crash Warning (FCW)

##### 4.2.4.1 Definition

The FCW safety application warns the driver of the HV in the case of an impending rear-end crash with an RV directly ahead in the same lane and direction of travel. The FCW is intended to help drivers avoid or mitigate rear-end vehicle crashes in the forward path of travel.

#### 4.2.4.2 FCW Use Case Scenarios

##### a. FCW: Stopped RV in Same Lane (Figure 4)

- The HV approaches RV-1, which is stopped in the same lane as the HV.
- The HV receives a warning from the FCW feature when there is imminent danger of a rear-end crash with the stopped RV-1 in its lane of travel.
- The timing of the warning is expected to be set such that the driver of the HV can avoid a rear-end crash with the stopped RV-1.

**Figure 4 - FCW – stopped RV in same lane**

##### b. FCW: Stopped RV in Adjacent Lane (Figure 5)

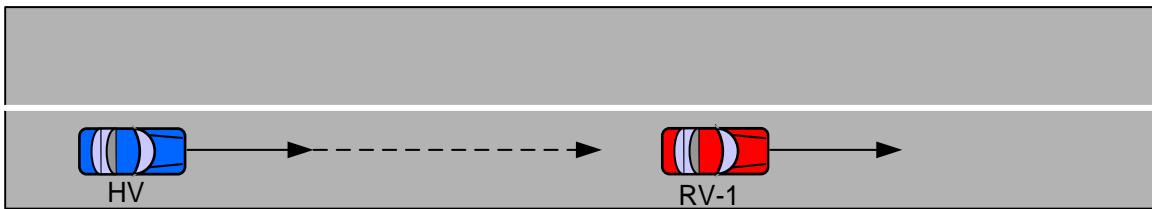

- The HV approaches RV-1, which is stopped in the lane adjacent to the HV.
- The driver of the HV does not receive a warning from the FCW feature since there is no imminent danger of a rear-end crash.

**Figure 5 - FCW – stopped RV in adjacent lane**

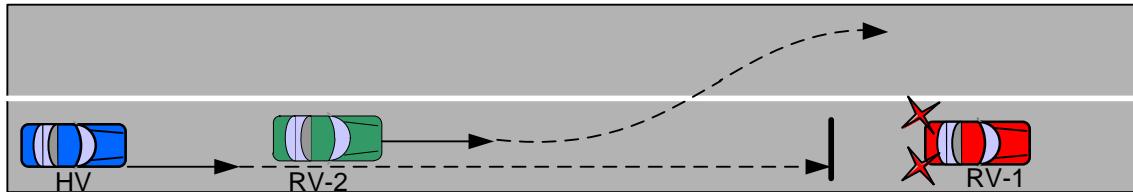

##### c. FCW: Slower-Moving or Decelerating RV in Same Lane (Figure 6)

- The HV approaches RV-1, which is moving slower and/or decelerating in the same lane as the HV.
- The HV driver receives a warning from the FCW feature when there is imminent danger of a rear-end crash with the slow-moving RV-1 in its lane of travel.
- The timing of the warning is expected to be set such that the driver can avoid a rear-end crash with the slow-moving RV-1.

**Figure 6 - FCW – slow-moving RV in same lane**

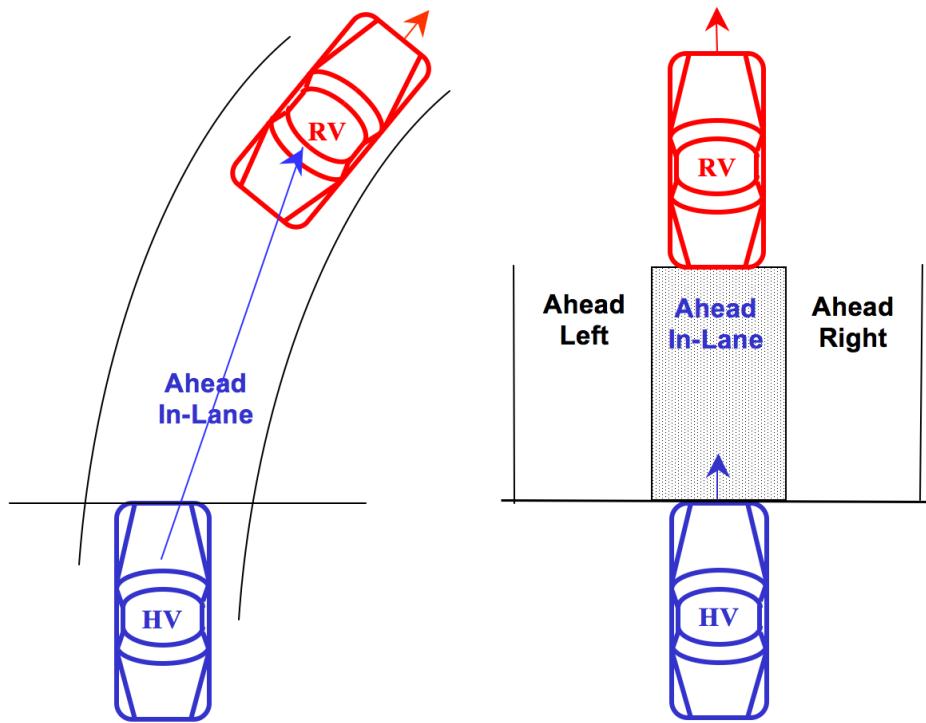

- d. FCW: Stopped and Obstructed RV (Figure 7)
- The HV follows a moving RV-2, which in turn approaches RV-1 that is stopped in the same lane. RV-2 may or may not be equipped with V2V communications, but RV-1 is equipped with V2V capability.
- RV-2 makes a lane change to avoid the stopped RV-1.
- The HV driver receives a warning from the FCW feature when there is imminent danger of a rear-end crash with the stopped RV-1 in its lane of travel.
- The timing of the warning is expected to be set such that the driver of the HV can avoid a rear-end crash with the stopped vehicle RV-1.

**Figure 7 - FCW – stopped and Obstructed RV**

#### 4.2.4.3 FCW Feature Systems Description

The FCW warns the driver of the HV when there is imminent danger of a rear-end crash with a remote lead vehicle in its lane of travel. The FCW feature is expected to function in both straight and curved roadway geometries. The relevant RV zones for the FCW feature are illustrated in Figure 8.

**Figure 8 - Relevant RV zones for FCW feature**

FCW performs the following operations:

- Analyzes received BSMs from each of the RVs and determines which of the RVs are classified as “ahead in-lane” to determine if the HV is at risk of being involved in a rear-end crash with an RV located in the same lane of travel.
- Determines which, if any, RVs classified as “ahead in-lane” are within a range threshold.
- Calculates time to crash (TTC) and/or crash avoidance range for each “ahead in-lane” RV to determine potential forward crash threats.
- Identifies the principal threat, if at least one RV is determined to be a threat.
- Provides a warning to the driver via a DVI.

#### 4.2.5 Blind Spot Warning/Lane Change Warning (BSW/LCW)

##### 4.2.5.1 Definition

The BSW/LCW safety application warns the driver of the HV during a lane change attempt if the blind-spot zone into which the HV intends to move is, or will soon be, occupied by another vehicle traveling in the same direction. Moreover, the application may also provide advisory information that is intended to inform the driver of the HV that a vehicle in an adjacent lane is positioned in a blind-spot zone of the HV when a lane change is not being attempted.

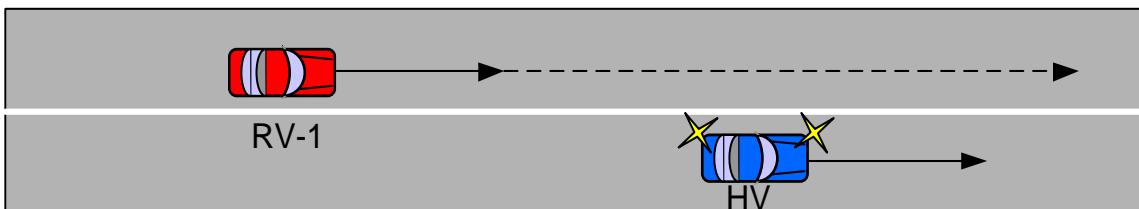

#### 4.2.5.2 BSW/LCW Use Case Scenarios

- a. BSW/LCW: RV in blind-spot zone (Figure 9)
  - The HV drives in its lane while RV-1 is alongside the HV within the blind-spot zone.
  - The HV driver may receive an advisory warning from the BSW/LCW feature indicating the presence of RV-1 in the blind-spot zone.
  - The HV driver receives a warning if the HV detects the driver's intent to change lanes into the lane occupied by RV-1 (for example through the use of the turn signal).
  - The timing of the warning is expected to be set such that the driver of the HV can avoid a crash with RV-1 in the adjacent lane.

**Figure 9 - BSW – RV in blind-spot zone**

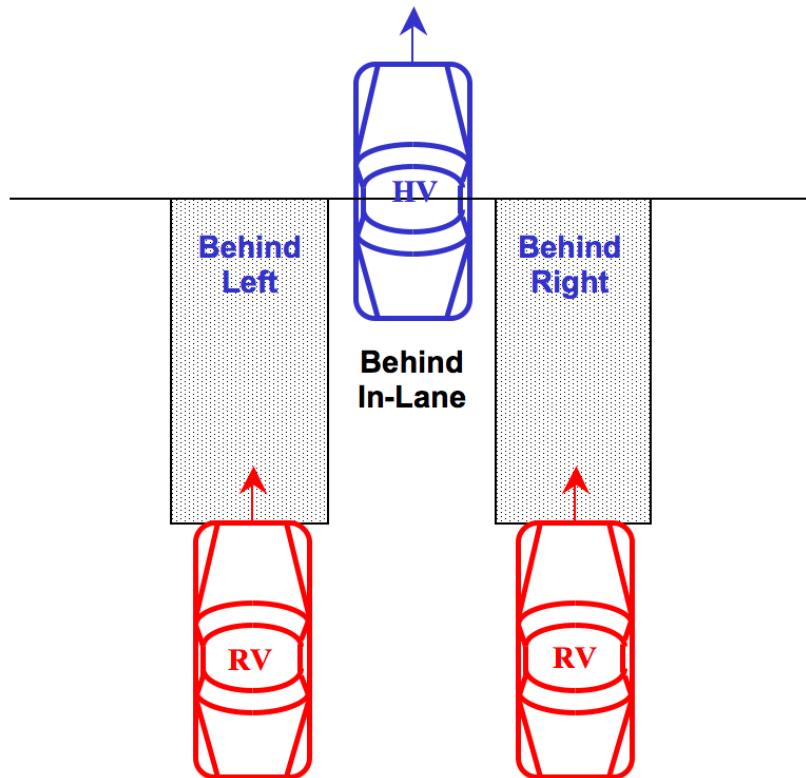

- b. BSW/LCW: Approaching RV in adjacent lane (Figure 10)
  - The HV drives in its lane. A faster moving RV-1 traveling in the same direction in an adjacent lane will soon occupy the HV's blind-spot zone.
  - The HV driver may receive an advisory warning from the BSW/LCW feature anticipating the presence of RV-1 in the blind-spot zone.
  - The HV driver receives a warning if the HV detects the driver's intent to change lanes into the lane that will soon be occupied by RV-1.
  - The timing of the warning is expected to be set such that the driver of the HV can avoid a crash with a faster-moving RV-1 in the adjacent lane.

**Figure 10 - LCW – approaching RV in adjacent lane**

#### 4.2.5.3 BSW/LCW Feature Systems Description

The BSW/LCW safety application warns the driver of the HV during an attempted lane change if the blind-spot zone into which the HV intends to move is, or will soon be, occupied by another vehicle traveling in the same direction. The relevant RV zones to the BSW/LCW feature are illustrated in Figure 11. The BSW/LCW feature is expected to function in straight and curved roadway geometries.

**Figure 11 - Relevant RV zones for BSW/LCW feature**

BSW/LCW performs the following operations:

- Determines which RVs have been classified as behind in the adjacent left lane or behind in the adjacent right lane relative to the HV.
- Evaluates the position of each RV relative to the HV to determine if that RV is currently positioned within the HV's blind-spot zone or if that RV is predicted to soon be within the HV's blind-spot zone.
- Sets the threat status corresponding to each side (left and right) to advise the HV driver if an RV is or will be located in the corresponding left or right blind spot.
- Sets the threat status to warn the HV driver of the current or predicted presence of a threat in an adjacent lane during an attempted lane-change maneuver.
- Provides an advisory or warning to the driver via a DVI.

#### 4.2.6 Intersection Movement Assist (IMA)

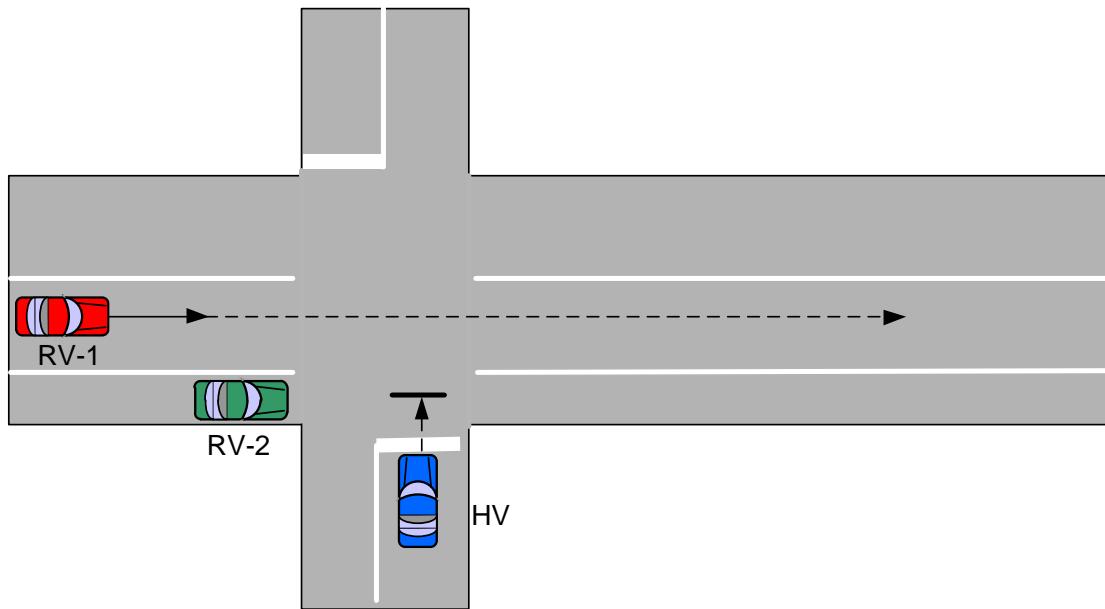

##### 4.2.6.1 Definition

The IMA safety application warns the driver of an HV when it is not safe to enter an intersection due to a crash possibility with RVs.

##### 4.2.6.2 IMA Use Case Scenarios

###### a. IMA: Stopped HV at Intersection (Figure 12)

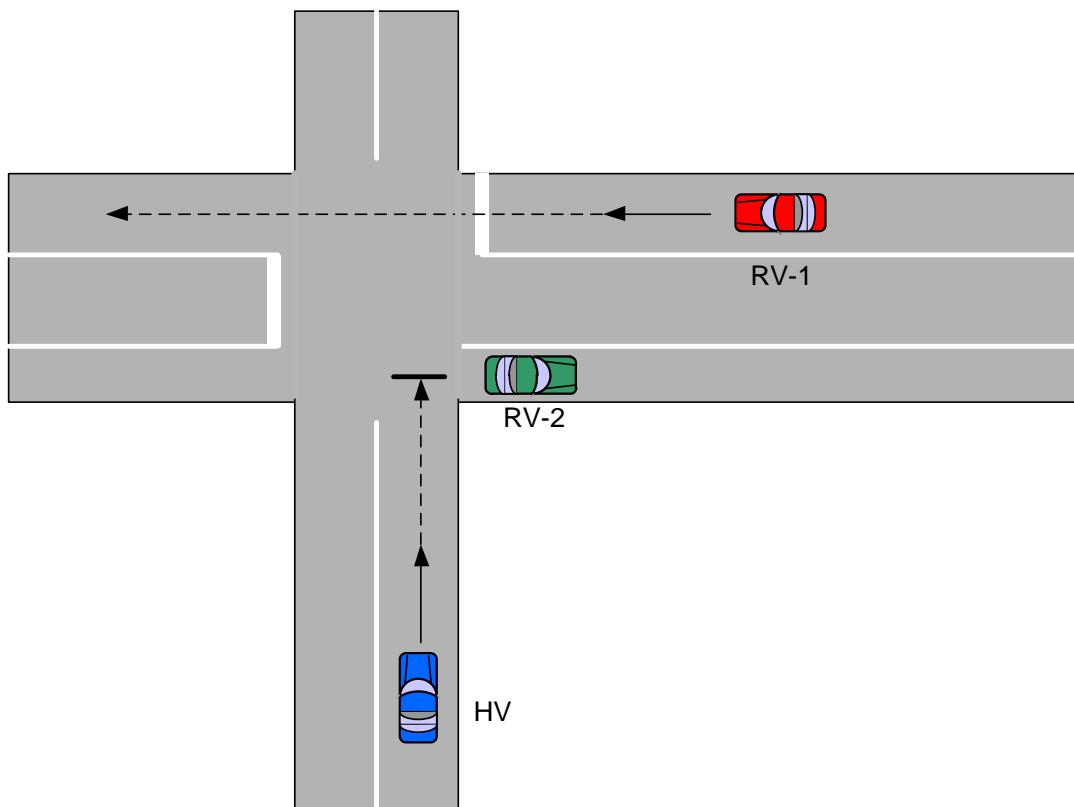

- The HV is stopped at an intersection and visibility may be limited by the presence of RV-2. RV-2 may or may not be equipped with V2V communications, which has no impact on the scenario, but RV-1 is equipped with V2V capability.
- RV-1 approaches the intersection from the left or right of the HV.
- The HV driver receives a warning from the IMA feature indicating that a crash is predicted with RV-1 if the HV begins to enter the intersection.
- The timing of the warning is expected to be set such that the driver of the HV can avoid a crash with the approaching RV-1.

**Figure 12 - IMA - stopped HV at the intersection**

###### b. IMA: Both Vehicles Approaching Intersection (Figure 13)

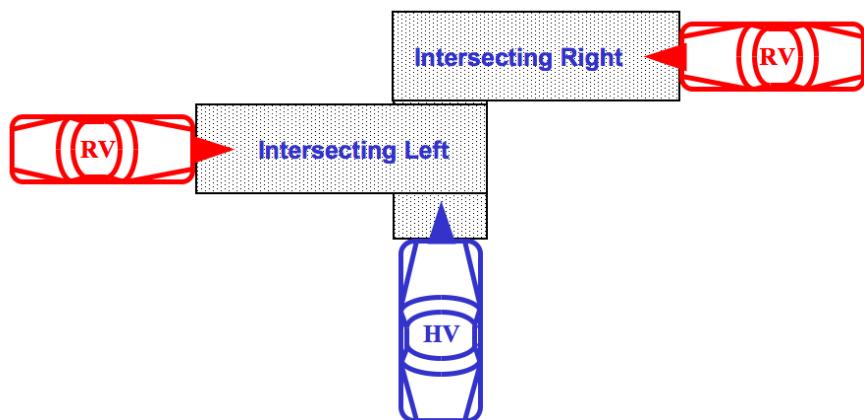

- The HV approaches the intersection and visibility may be limited by the presence of RV-2. RV-2 may or may not be equipped with V2V communications, but RV-1 is equipped with V2V capability.
- RV-1 approaches the intersection from the left or right of the HV.
- The HV driver receives a warning from the IMA feature indicating that a conflict is predicted with RV-1 if the HV tries to enter the intersection.
- The timing of the warning is expected to be set such that the driver of the HV can avoid a crash with the approaching vehicle, RV-1.

**Figure 13 - IMA – both vehicles approaching intersection**

#### 4.2.6.3 IMA Feature Systems Description

IMA warns the driver of the HV when there is imminent danger of a crash with a remote vehicle that is approaching the same intersection. The relevant RV zones for the IMA feature are illustrated in Figure 14.

**Figure 14 - Relevant RV zones for IMA feature**

IMA performs the following operations:

- Analyzes received BSMs from RVs approaching the intersection and determines which of the RVs are classified as “intersecting left” or “intersecting right.”
- Determines which, if any, RVs classified as “intersecting left” or “intersecting-right” are within a lateral range threshold.
- Calculates time-to-intersection (TTI) and distance-to-intersection (DTI) for each “intersecting left” or “intersecting right” RV to determine if the HV is at risk of being involved in a crash with an RV traveling toward the same intersection.
- Identifies the principal threat, if at least one RV is determined to be a threat.
- Provides a warning to the driver via a DVI.

#### 4.2.7 Left Turn Assist (LTA)

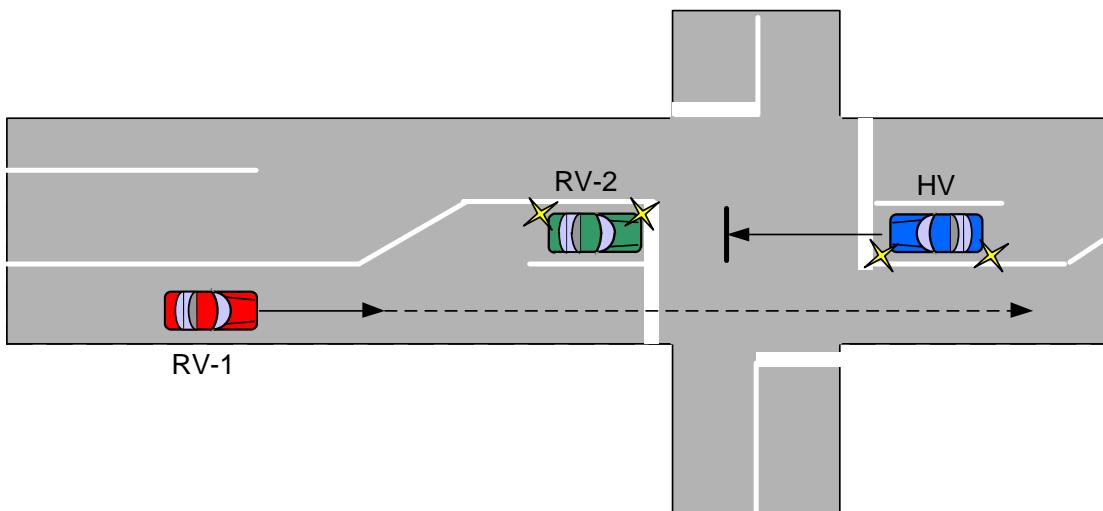

##### 4.2.7.1 Definition

The LTA safety application warns the driver of an HV that, due to oncoming traffic, it may not be safe to proceed when attempting a left turn.

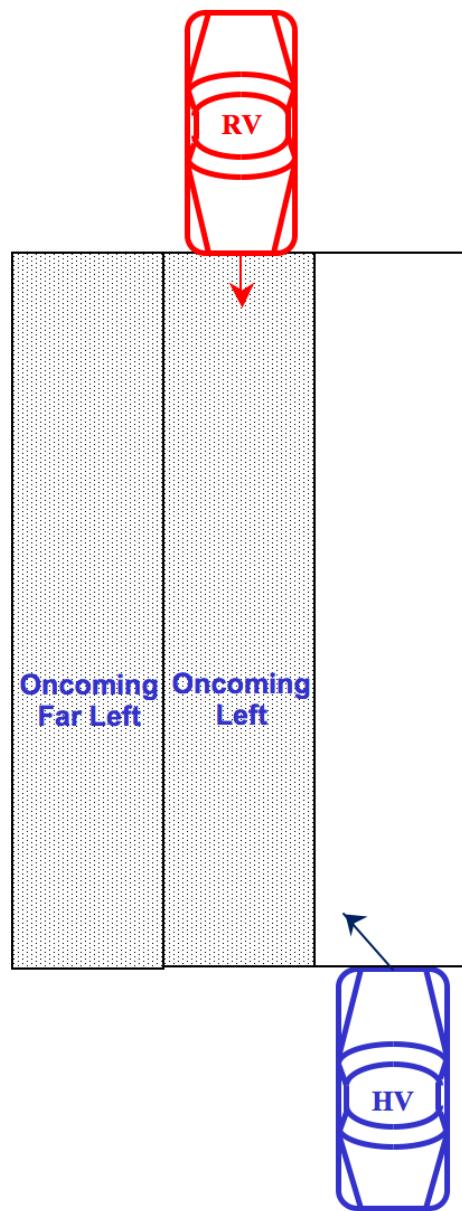

##### 4.2.7.2 LTA Use Case Scenarios

###### a. LTA: Left Turn Across Path (Figure 15)

- The HV approaches an intersection to make a left turn and visibility may be limited or obstructed by RV-2. RV-2 may or may not be equipped with V2V communications, but RV-1 is equipped with V2V capability.
- RV-1 approaches the intersection from the opposite direction.
- The HV driver receives a warning from the LTA feature when the HV driver attempts a left turn.
- The timing of the warning is expected to be set such that the driver of the HV can avoid a crash with the approaching vehicle, RV-1.

*Figure 15 - LTA – left turn across path*

**Figure 16 - Relevant RV zones for LTA feature**

#### 4.2.7.3 LTA Feature Systems Description

LTA should warn a driver intending to make a left turn across an intersection path when there is imminent danger of a crash with an RV in an oncoming opposite lane of travel. The relevant RV zones for the LTA feature are illustrated in Figure 16.

LTA performs the following operations:

- Analyzes received BSMs from the RVs approaching the intersection and determines which of the RVs are classified as “oncoming left” or “oncoming far left” to determine if the HV is at risk of being involved in an intersecting crash with an RV approaching in an oncoming lane of travel.
- Determines which, if any, RVs classified as “oncoming left” or “oncoming far left” are within a range threshold.
- Calculates the clearance gap for each “oncoming left” or “oncoming far left” RV to determine potential intersecting crash threats.

- Identifies the principal threat, if at least one RV is determined to be a threat.
- Provides a warning to the driver via a DVI.

#### 4.2.8 Control Loss Warning (CLW)

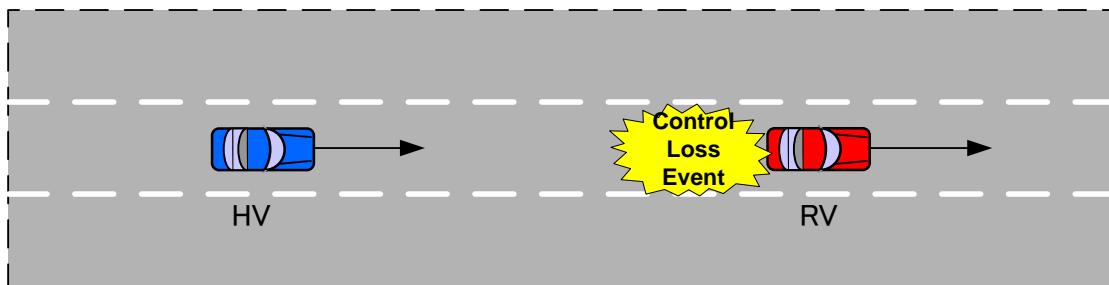

##### 4.2.8.1 Definition

The CLW safety application warns the driver of the HV in the case of an emergency control loss event (defined as activation of the Antilock Brake System, Traction Control System, or Stability Control System) by an RV traveling in the same or opposite direction. The RV broadcasts control loss event information within the BSM. Upon receiving such event information, the HV determines the relevance of the event and provides a warning to the driver of the HV.

##### 4.2.8.2 CLW Use Case Scenarios

###### a. CLW: RV Same Direction of Travel (Figure 17)

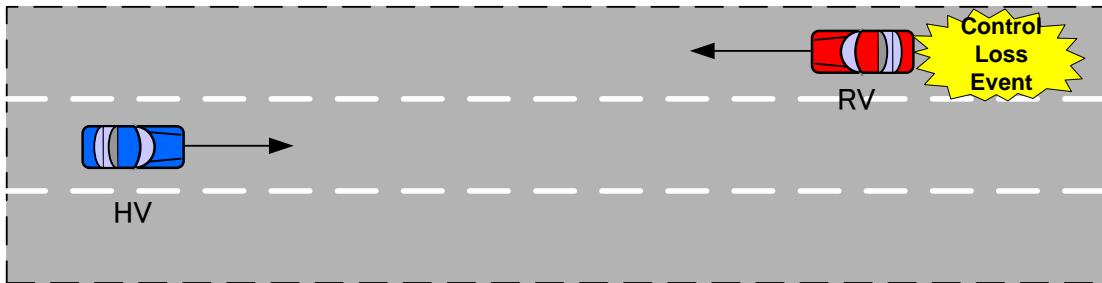

- The HV follows the RV in the same direction.
- The HV receives BSMs from the RV indicating a control loss event (Antilock Brake System, Traction Control System or Stability Control System active).
- The timing of the corresponding warning to the driver is expected to be such that the driver of the HV can avoid a crash with the RV.

**Figure 17 - CLW – RV same direction of travel**

###### a. CLW: RV Traveling in Opposite Direction (Figure 18)

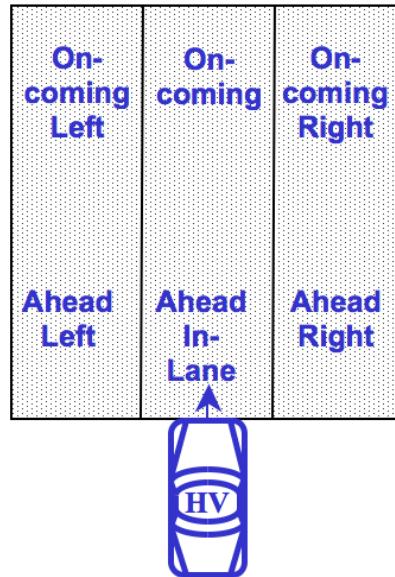

- The RV approaches the HV from the opposite direction.
- The HV receives BSMs from the oncoming RV indicating a control loss event (Antilock Brake System, Traction Control System or Stability Control System activated).
- The timing of the corresponding warning to the driver is expected to be such that the driver of the HV can avoid a crash with the RV.

**Figure 18 - CLW – RV traveling in opposite direction**

#### 4.2.8.3 CLW Feature Systems Description

The CLW safety application warns the driver of the HV in the case of an emergency control loss event by an RV traveling in the same or opposite direction. The relevant zones for the CLW features are illustrated in Figure 19.

**Figure 19 - Relevant RV zones for CLW feature**

CLW performs the following operations:

- The RV broadcasts a control loss event in the BSM upon activation of the Antilock Brake System, Traction Control System, or Stability Control System.

Upon receiving such event information, the HV performs the following operations:

- Determines which, if any, RVs have reported a control loss event.
- For each RV that has reported an event and is classified as “ahead in-lane,” “ahead left,” “ahead right,” “oncoming,” “oncoming left,” or “oncoming right,” determines if the range or TTC is less than a threshold value.
- Calculates the CLW threat levels among all RVs identified above, determines the principal threat, and sets the appropriate threat status.
- Provides a warning to the driver via a DVI.

## 5. INTERFACE DESCRIPTION

### 5.1 V2V Over-the-Air Data Description

#### 5.1.1 Basic Safety Message Exchange

The BSM, which is defined in SAE J2735 [1], is the message used for V2V safety communications in this standard. Each vehicle broadcasts (see 0) BSMs to provide neighboring vehicles with trajectory and status information. **With a sufficiently high population of DSRC equipped vehicles, the number of BSMs being transmitted can congest the channel, necessitating congestion control procedures.** The BSM consists of all data elements listed in Part I and selected data elements and data frames listed in Part II of the SAE J2735 standard. Part I contains the vehicle position, speed, heading, acceleration, transmission, steering-wheel angle, brake, and vehicle-size information.

For the System defined in this standard, the following additional information is transmitted as part of the Part II Vehicle Safety Extension:

- Event Flags, which convey the sender’s status with respect to safety-related events such as Antilock Brake System (ABS) activation, Stability Control activation, and Hard Braking.
- Path History, which provides a concise representation of the vehicle’s recent movement. It consists of a sequence of positions selected to represent the vehicle’s path within an allowable error.
- Path Prediction, which provides an estimate of the vehicle’s future trajectory. The trajectory is represented as a radius of curvature.
- Exterior Lights, which provides the vehicle light status, including turn signals.

#### 5.1.2 Positioning

Many V2V safety applications need relative positioning of the HV and RVs with lane-level granularity. For example, a safety application can determine if the HV and an RV are in the same or adjacent lanes. The System includes a GNSS receiver to enable the System to determine its own position and accurate time. The System also maintains its own path history and calculates its path prediction. Each vehicle broadcasts its time-tagged position, heading, speed, and acceleration, plus its path history and path prediction in the BSM. Based on the HV and RV information, the System can calculate the range, range-rate, difference in headings, and relative position between vehicles. The path history and path prediction information are used to estimate the relative lane positioning between the HV and RV.

### 5.1.3 Security and Privacy

#### 5.1.3.1 Signing and Verification Algorithm

To support trust in message exchange between vehicles, BSM signing and verification are performed using a public key digital signature algorithm. The transmitter computes a signature using an Elliptic Curve Digital Signature Algorithm (ECDSA) with a private key, and the receiver verifies the signature using the associated certificate.

#### 5.1.3.2 BSM Signature and Certificate Transmission

Each BSM is transmitted with a signature and either a security certificate containing the public key or a certificate digest (hash of the current security certificate). The BSM with a certificate is transmitted approximately every 500 ms (see 6.5.2), and other BSMs are transmitted with a certificate digest to reduce the overall message length. The receiver buffers recently received certificates and is able to identify the certificate corresponding to a received digest.

#### 5.1.3.3 BSM Verification

The receiver can verify every message or use a Verify on Demand (VOD) approach 0 whereby only a subset of BSMs is verified. For example, the receiver may verify only BSMs containing information that would trigger an alert to the driver, or the receiver may verify a subset of messages received to support other functional requirements. Upon selecting a BSM for verification, if the BSM contains a security certificate, the receiver uses the public key in the certificate to perform the verification. If the BSM contains a digest, the receiver can use the digest to identify the corresponding buffered certificate for use in the verification. In certain cases a System may obtain (learn) certificate information from peer Systems over the same interface.

#### 5.1.3.4 SCMS

The SCMS is responsible for generating and distributing security certificates. The SCMS is also responsible for generating and distributing a Certificate Revocation List (CRL), which contains a list of linkage information that all receiving devices can use to identify non-trustworthy certificates. Certificates and the CRL are stored within the OBE System, and are updated by the SCMS. A well-behaved System does not send a BSM if its linkage information is on the CRL. If a receiver receives a BSM with linkage information on the CRL, the BSM is considered invalid. More information about the CRL is available in 1609.2 [3]. For the initial equipping of a System, it interfaces to a Device Configuration Manager (DCM) to acquire the Root Certificate Authority (CA) certificate (see 6.6.1).

#### 5.1.3.5 Privacy

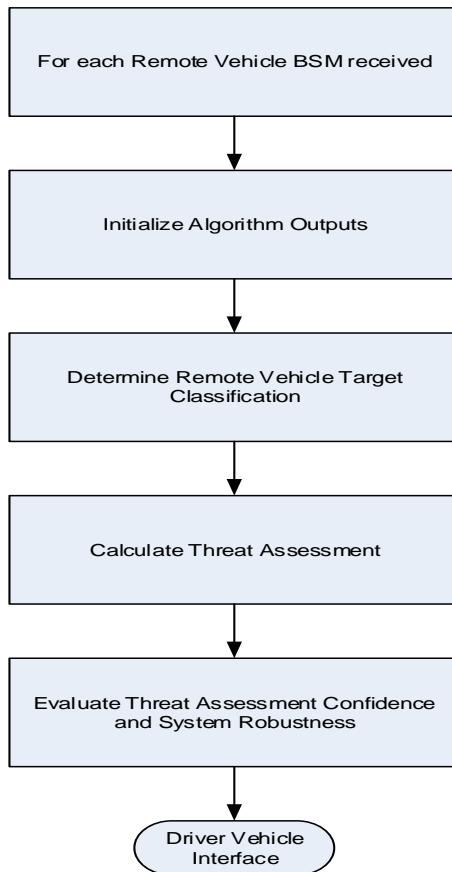

To protect privacy, the signing security certificate is changed after a variable length of time (for example every five minutes), and fields within the broadcast message (DE\_MsgCount, DE\_TemporaryID and the DSRC radio MAC address) are randomized whenever the certificate is changed. The SCMS is structured as a set of components, so the component generating the certificates has no knowledge of which certificates are used by a particular device. For a more detailed description of the SCMS and associated security system design and operation see 0 and 0.

### 5.1.4 Startup and Shutdown

To ensure performance, Systems include additional capabilities related to device startup and shutdown. Systems store the last known heading and path history information on shutdown so they can be retrieved for use in BSMs upon the next System device startup. Systems also randomize their message generation schedule upon startup to avoid repeated packet collisions of transmitted BSMs with those transmitted by other Systems.

### 5.1.5 Mapping to the V2V Over-the-Air Data

A generic logic design of the safety features is shown by the flowchart in Figure 20. Table 4 provides a mapping to the V2V over-the-air data.

**Figure 20 - Safety feature logic****Table 4 - Mapping crash scenarios to the V2V over-the-air data**

V2V Safety Message BSM Contents (see J2735 [1])		FCW, BSW/LCW, IMA Stopped, LTA	EEBL, CLW, IMA Moving
DE_DSecond DE_Latitude DE_Longitude DE_Elevation DF_PositionalAccuracy DE_Heading	Relative Road Level Positioning  Relative Lane Level Positioning	Required for: <ul style="list-style-type: none"><li>• Relative Road Level Target Classification</li><li>• Threat Assessment</li><li>• Threat Assessment Confidence and System Robustness</li></ul>	Required for: <ul style="list-style-type: none"><li>• Relative Lane Level Target Classification</li><li>• Threat Assessment</li><li>• Threat Assessment Confidence and System Robustness</li></ul>

**Table 4 - Mapping crash scenarios to the V2V over-the-air data (continued)**

V2V Safety Message BSM Contents (see J2735 [1])	FCW, BSW/LCW, IMA Stopped, LTA	EEBL, CLW, IMA Moving

DE_VehicleEventFlags		Required for (EEBL and CLW only): <ul style="list-style-type: none"><li>• Hard-Braking Event Notification</li><li>• Control-Loss Event Notification</li></ul>

**NOTE:** The positioning and other related data (e.g., speed, heading) accuracy requirements in this standard are designed to meet the relative lane level positioning needs of the crash scenarios described in the preceeding Sections (see 0 through 6.3.6.12).

### 5.1.6 Objective Tests Conducted for V2V Safety Applications (informative)

Details and results from testing for the crash scenarios described in this Standard can be found in the VSC-A final report, Appendices C-2 and C-3 [13]. Refer to the report for details.

## 5.2 System Interfaces

This Section provides an overview of the System interfaces. Section 6 provides the detailed requirements for these interfaces.

### 5.2.1 Vehicle to Vehicle Communications Interface

The System interfaces to other vehicles (Systems) by transmitting and receiving BSMs.

- The format and contents of the BSM are compliant with SAE J2735 [1].
- The BSM is transmitted as a Wireless Access in Vehicular Environments (WAVE) Short Message (WSM) using the WAVE Short Message Protocol (WSMP) as defined in IEEE 1609.3 [4].
- BSM security is compliant with IEEE 1609.2 [3].

- The over-the-air Medium Access Control (MAC) and Physical Layer (PHY) protocol are compliant with IEEE 1609.4 [5] and IEEE 802.11 [2].
- The WSM Provider Service ID (PSID) is set as specified in IEEE 1609.12 [6].

Section 6.1 of this standard profiles the applicable requirements from each of these standards.

### 5.2.2 System to SCMS Communications Interface

The System interfaces to the SCMS to request security credential generation, download security credentials, and receive CRLs. Learning security credentials from other Systems that interface to the SCMS can also be used. The requirements listed in this standard are based on the following reports, which include dialogs and other SCMS interface details:

- CAMP Vehicle Safety Communications Security Studies: Study 1 – Security Credential Management System 0.
- CAMP Vehicle Safety Communications Security Studies: Study 3 Final Report: Protocols and Components of the SCMS 0.

Section 6.6 of this standard defines the applicable requirements for interfacing to the SCMS.

### 5.2.3 System to Positioning Subsystem Interface

The System has access to Positioning Subsystem information to meet the positioning and timing requirements of Section 0.

## 6. MINIMUM REQUIREMENTS

### 6.1 Standards Profiles (STD)

The Standards Compliance subsections below describe the requirements from the corresponding standards necessary to support V2V operation. Additional requirements apply if the System optionally supports the SCMS interface via DSRC-equipped Roadside Equipment (RSE). If a clause from the referenced standard is not explicitly referenced below, then it and its sub-clauses are considered informative or optional and not required for either V2V or SCMS operation, unless they are implicitly referenced from one of the mandatory clauses of that referenced standard.

#### 6.1.1 IEEE 802.11 (802.11)

This Section specifies the requirements from IEEE 802.11 [2] to support V2V and SCMS operation, as described in Section 6.1. Items marked V2V in the Required For column are always required, and items marked SCMS are required only if interfacing to an SCMS over DSRC is implemented.

**Table 5 - IEEE 802.11 requirements**

802.11 Clause	Title (802.11 Clause)	Required For	Requirement
4.3.11	STA transmission of data frames outside the context of a BSS	V2V	The DSRC Radio Subsystem shall operate within the procedures for STA transmission of data frames outside the context of a BSS (dot11OCBActivated=True), as specified. [6.1.1-V2V-STD-802.11-001]
5	MAC Service Definition		
5.1	Overview of MAC services	V2V	The DSRC Radio Subsystem shall comply with MAC services with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-002]
5.2	MAC data service specification	V2V	The DSRC Radio Subsystem shall comply with MAC data service specification features with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-003]

**Table 5 - IEEE 802.11 requirements (continued)**

<b>802.11 Clause</b>	<b>Title (802.11 Clause)</b>	<b>Required For</b>	<b>Requirement</b>
6	Layer Management		
6.3	MLME-SAP interface		Note: MLME-SAP primitives provide guidance when determining actual requirements. The DSRC Radio Subsystem includes the specified functionality corresponding to each service primitive, but the method in which it is implemented is implementation specific.
6.3.10, 6.5.2	Reset	V2V	The DSRC Radio Subsystem shall be capable of changing the radio MAC address during operation [6.1.1-V2V-STD-802.11-004]
6.3.42	Get TSF timer	SCMS	If TSF timer capabilities are used for time synchronization, the DSRC Radio Subsystem shall use the TSF timer as specified. Other methods may also be utilized for enhanced time synchronization. [6.1.1-V2V-STD-802.11-005]
7	PHY service specification		
7.1	Scope	V2V	The DSRC Radio Subsystem shall be capable of PHY services with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-006]
7.2	PHY functions	V2V	The DSRC Radio Subsystem shall be capable of PHY services with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-007]
7.3	Detailed PHY service specification	V2V	The DSRC Radio Subsystem shall be capable of PHY services with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-008]
8	Frame Formats		
8.1	General requirements	V2V	The DSRC Radio Subsystem shall comply with the frame format general requirements with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-009]
8.2	MAC frame formats	V2V	The DSRC Radio Subsystem shall comply with the MAC frame formats with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-010]
8.3	Format of individual frame types		
8.3.1	Control Frames		
8.3.1.1	Format of control frames	SCMS	If interfacing to an SMCS over DSRC is implemented by the System, the DSRC Radio Subsystem shall comply with the control frame format with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-011]
8.3.1.4	ACK frame format	SCMS	If interfacing to an SMCS over DSRC is implemented, the DSRC Radio Subsystem shall comply with the ACK frame format with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-012]
8.3.2	Data Frames	V2V	The DSRC Radio Subsystem shall comply with the data frame with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-013]

**Table 5 - IEEE 802.11 requirements (continued)**

<b>802.11 Clause</b>	<b>Title (802.11 Clause)</b>	<b>Required For</b>	<b>Requirement</b>
8.3.2.1	Data Frame Format	V2V	<p>The DSRC Radio Subsystem shall set the data frame fields to the following values for V2V operation:</p> <p>Frame Control (bits)</p> <ul style="list-style-type: none"> <li>• Protocol version=00</li> <li>• Type = 10 (Data)</li> <li>• Subtype = 1000 (QoS Data)</li> <li>• ToDS = 0</li> <li>• FromDS = 0</li> <li>• More Fragments = 0</li> <li>• Retry = 0</li> <li>• Power Mgmt = 0</li> <li>• More Data = 0</li> <li>• Protected Frame = 0</li> <li>• Order = 0</li> </ul> <p>Duration ID = 0</p> <p>Address 1 (destination) = ff ff ff ff ff ff</p> <p>Address 2 (source) = &lt;random 6 octets, changed per rules defined in Section 6.5.1&gt;</p> <p>Address 3 (BSS ID) = ff ff ff ff ff ff</p> <p>Sequence Control</p> <ul style="list-style-type: none"> <li>• Fragment Number = 0</li> <li>• Sequence Number = &lt;incrementing value for each transmitted frame&gt;</li> </ul> <p>Address 4 field is omitted</p> <p>QoS Control</p> <ul style="list-style-type: none"> <li>• TID (bits 0-3) = &lt;User Priority (0-7)&gt;</li> <li>• EOSP (bit 4) = 0</li> <li>• Ack Policy: bit 5=1, bit 6=0 (No ACK)</li> <li>• A-MSDU Present (bit 7) = 0</li> <li>• Tx Op Duration Req (bits 8-15) = 0</li> </ul> <p>HT Control field is omitted</p> <p>Frame Body content is defined by the higher layers and shall not exceed 1500 octets</p> <p>FCS contains the 32-bit CRC of the MAC header and frame body field.</p> <p>[6.1.1-V2V-STD-802.11-014]</p>

**Table 5 - IEEE 802.11 requirements (continued)**

<b>802.11 Clause</b>	<b>Title (802.11 Clause)</b>	<b>Required For</b>	<b>Requirement</b>
8.4.2.31	EDCA Parameter Set element	V2V	The DSRC Radio Subsystem shall comply with the EDCA parameter set element, with the default EDCA values set as specified in Section 0 of this standard. [6.1.1-V2V-STD-802.11-015]
9	MAC sublayer functional description		
9.2	MAC Architecture		
9.2.4	Hybrid Coordination Function	V2V	The DSRC Radio Subsystem shall comply with the Enhanced Distributed Channel Access (EDCA) mechanism of the Hybrid Coordination Function (HCF) with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-016]
9.7	Multirate support	V2V	The DSRC Radio Subsystem shall comply with the multirate support feature with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-017]
9.19	HCF		
9.19.1	General	V2V	The DSRC Radio Subsystem shall comply with the HCF general features with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-018]
9.19.2	HCF contention-based channel access (EDCA)	V2V	The DSRC Radio Subsystem shall comply with the HCF contention-based channel access (EDCA) features with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-019]
10	MLME		
10.1	Synchronization	V2V	The DSRC Radio Subsystem shall comply with the MLME synchronization feature with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-020]
10.20	STAs communicating data frames outside the context of a BSS	V2V	The DSRC Radio Subsystem shall comply with the protocol of STAs communicating data frames outside the context of a BSS, with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-021]
18	Orthogonal frequency division multiplexing (OFDM) PHY specification	V2V	The DSRC Radio Subsystem shall comply with the orthogonal frequency division multiplexing (OFDM) PHY specification with dot11OCBActivated equal to true, with 10 MHz channel spacing, as specified. [6.1.1-V2V-STD-802.11-022]
Annex C	ASN.1 encoding of the MAC and PHY MIB	V2V	The DSRC Radio Subsystem shall include the MIB items used to support OFDM and the features with dot11OCBActivated equal to true, as specified. [6.1.1-V2V-STD-802.11-024]
Annex D	Regulatory references		
Annex D.1	External regulatory references	V2V	The DSRC Radio Subsystem shall comply with the United States Federal Communications Commission (FCC) specifications, as specified. [6.1.1-V2V-STD-802.11-025]
Annex D.1	External regulatory references	V2V	The DSRC Radio Subsystem shall comply with the behavior limits set for ITS_mobile_operations, as specified. [6.1.1-V2V-STD-802.11-026]
Annex D2.1	Transmit and receive in-band and out-of-band spurious emissions	V2V	The DSRC Radio Subsystem shall comply with transmit and receive in-band and out-of-band spurious emissions, as specified. [6.1.1-V2V-STD-802.11-027]
Annex D2.2	Transmit power levels	V2V	The DSRC Radio Subsystem shall comply with the transmit power level requirements for STA transmit power classification C, as specified. [6.1.1-V2V-STD-802.11-028]
Annex D2.3	Transmit spectrum mask	V2V	The DSRC Radio Subsystem shall comply with the transmit spectrum mask requirements for 10 MHz channel spacing for STA transmit power classification C, as specified. [6.1.1-V2V-STD-802.11-029]

**Table 5 - IEEE 802.11 requirements (continued)**

<b>802.11 Clause</b>	<b>Title (802.11 Clause)</b>	<b>Required For</b>	<b>Requirement</b>
Annex E	Country elements and operating classes		
Annex E.1	Country information and operating classes	V2V	The DSRC Radio Subsystem shall comply with the country element and operating classes, as specified to support operating class 17, channel <i>vChannelNumber</i> . [6.1.1-V2V-STD-802.11-030]
Annex E.1	Country information and operating classes	SCMS	If interfacing to an SMCS over DSRC is implemented, the DSRC Radio Subsystem shall comply with the country element and operating classes, as specified to support operating class 17. [6.1.1-V2V-STD-802.11-031]
Annex E.2.3	5.9 GHz band in the United States (5.850-5.925 GHz)	V2V	The DSRC Radio Subsystem shall comply with the rules to support the 5.9 GHz band in the United States (5.850-5.925 GHz), as specified. [6.1.1-V2V-STD-802.11-032]

### 6.1.2 IEEE 1609.2 (1609.2)

This Section specifies the requirements from IEEE 1609.2 [3] to support V2V and SCMS operation, as described in Section 6.1.

#### 6.1.2.1 PICS Proforma (informative)

This Section provides an example Protocol Implementation Conformance Statement (PICS) from IEEE 1609.2 [3]. Implementers typically use a PICS to indicate compliance with particular features in the standard. The Item column contains a feature identifier; the Security configuration column contains a feature description; the reference column contains the clause number for the 1609.2 standard, and the status column indicates if the feature is mandatory or optional. Items marked with "M" are mandatory, and items marked with "O" are optional. Multiple items marked with O followed by a number (e.g., O1) indicate that the implementer chooses at least one of the options. Finally, items marked C followed by a number (e.g., C1) indicate that the implementer chooses one of the two features.

In this Section items marked "Y" in the support column correspond to requirements in the security profile provided in 6.1.2.2, and items marked "N" do not correspond to the security profile. In some cases a value is included to provide further guidance to implementers. Items marked N/A do not apply to the security profile, and items marked O are optional within the security profile.

**Table 6 - IEEE 1609.2 Security services conformance statement**

<b>Item</b>	<b>Security configuration (top-level)</b>	<b>Reference</b>	<b>Status</b>	<b>Support</b>
S1.	<b>Support Secure Data Service</b>		O1	Y
S1.1.	<b>SDEE Identification</b>	4.2.2.1	S1:M	Y
S1.1.1.	Support only one SDEE	4.2.2.1	S1.1:C1	Choose one of these items
S1.1.2.	Distinguish between SDEEs	4.2.2.1	S1.1:C1	
S1.2.	<b>Generate SPDU</b>		S1:O2	Y
S1.2.1.	<b>Create Ieee1609Dot2Data containing Unsecured Data</b>	4.2.2.2.2	S1.2:O3	N

**Table 6 - IEEE 1609.2 Security services conformance statement (continued)**

Item	Security configuration (top-level)	Reference	Status	Support
S1.2.2.	Create Ieee1609Dot2Data containing valid SignedData	4.2.2.2.3, 5.2, 5.3.1, 5.3.3, 5.3.7, 6.3.4, 6.3.9, 9.3.9.1	S1.2:O3	Y
S1.2.2.1.	Using a valid HashAlgorithm	6.3.5	S1.2.2:M	Y
S1.2.2.1.1.	Support signing with hash algorithm SHA-256	6.3.5	S1.2.2:M	Y
S1.2.2.1.2.	Support signing with hash algorithm other than SHA-256	6.3.5	S1.2.2:O	N
S1.2.2.2.	Containing a Signed Data payload	6.3.6	S1.2.2:M	Y
S1.2.2.2.1.	... with payload containing data	6.3.7	S1.2.2.2:O4	Y
S1.2.2.2.2.	... with payload containing extDataHash	6.3.7	S1.2.2.2: O4	N
S1.2.2.2.3.	... with generationTime in the security headers	6.3.9, 6.3.11	S1.2.2.2: O	Y
S1.2.2.2.4.	... with expiryTime in the security headers	6.3.9, 6.3.11	S1.2.2.2: O	N
S1.2.2.2.5.	... with generationLocation in the security headers	6.3.9, 6.3.12	S1.2.2.2: O	N
S1.2.2.2.6.	... with certLearningRequest in the security headers	6.3.9, 6.3.24	S1.2.2.2: O	O
S1.2.2.2.7.	... with missingCrlIdentifier in the security headers	6.3.9, 6.3.16	S1.2.2.2: O	O
S1.2.2.2.8.	... with encryptionKey in the security headers	6.3.9, 6.3.18	S1.2.2.2: O	N
S1.2.2.2.8.1.	... ... With a PublicEncryptionKey	6.3.9, 6.3.18, 6.3.19	S1.2.2.2.8:O5	N
S1.2.2.2.8.2.	... ... With a SymmetricEncryptionKey	6.3.9, 6.3.18, 6.3.20	S1.2.2.2.8:O5	N
S1.2.2.3.	Support a SignerIdentifier	6.3.23	S1.2.2:M	Y
S1.2.2.3.1.	... of type digest	6.3.25	S1.2.2.3:O6	Y
S1.2.2.3.2.	... of type certificate	6.4.2	S1.2.2.3:O6	Y
S1.2.2.3.2.1.	... ... Maximum number of Certificates in the chain	5.1.2.2	S1.2.2.3.2 8:M >8:O	1
S1.2.2.3.3.	... of type self	6.3.23	S1.2.2.3:O6	N
S1.2.2.4.	Support a Signature	6.3.27	S1.2.2:M	Y
S1.2.2.4.1.	... a ecdsa256Signature	6.3.28	S1.2.2.4:M	Y
S1.2.2.4.1.1.	... ... using NIST p256	6.3.28	S1.2.2.4.1:O7	Y

**Table 6 - IEEE 1609.2 Security services conformance statement (continued)**

<b>Item</b>	<b>Security configuration (top-level)</b>	<b>Reference</b>	<b>Status</b>	<b>Support</b>
S1.2.2.4.1.2.	.... using Brainpool p256r1	6.3.28	S1.2.2.4.1:O7	N
S1.2.2.4.1.3.	.... with a x-only r value	6.3.29	S1.2.2.4.1:O8	Choose at least one of these items
S1.2.2.4.1.4.	.... with a compressed r value	6.3.29	S1.2.2.4.1:O8	
S1.2.2.4.1.5.	.... with an uncompressed r value	6.3.29	S1.2.2.4.1:O8	N
S1.2.2.5.	Determine that certificate used to sign data is valid (part of a consistent chain, valid at the current time and location, hasn't been revoked)	5.2, 6.4.2	S1.2.2:M	Y
S1.2.2.5.1.	Determine that the region is correct	6.4.8, 6.4.17	S1.2.2.5:O	Y
S1.2.2.5.1.1.	Support a circularRegion	6.4.17, 6.4.18	S1.2.2.5.1:O9	N
S1.2.2.5.1.2.	Support a rectangular region	6.4.17, 6.4.20	S1.2.2.5.1:O9	N
1.2.2.5.1.2.1.	Maximum number of rectangularRegions supported	6.4.17, 6.4.20	S1.2.2.5.1.2 8:M > 8:O	N/A
S1.2.2.5.1.3.	Support a polygonalRegion	6.4.17, 6.4.21	S1.2.2.5.1:O9	N
1.2.2.5.1.3.1.	Maximum number of points in a polygonalRegion	6.4.17, 6.4.21	S1.2.2.5.1.3 8:M > 8:O	N/A
S1.2.2.5.1.4.	Support identifiedRegion	6.4.17, 6.4.22	S1.2.2.5.1:O9	Y
1.2.2.5.1.4.1.	Maximum number of identifiedRegions supported	6.4.17, 6.4.22	S1.2.2.5.1.4: 8:M > 8:O	Minimum of 3 Note: US, Canada, Mexico supported as defined by the United Nations Statistics Division, October 2013 edition.
1.2.2.5.1.4.2.	Support IdentifiedRegion of type CountryOnly	6.4.22, 6.4.23	S1.2.2.5.1.4:O10	Y
1.2.2.5.1.4.3.	Support IdentifiedRegion of type CountryAndRegions	6.4.22, 6.4.24	S1.2.2.5.1.4:O10	N
1.2.2.5.1.4.4.	Support IdentifiedRegion of type CountryAndSubregions	6.4.22, 6.4.25	S1.2.2.5.1.4:O10	N

<b>Item</b>	<b>Security configuration (top-level)</b>	<b>Reference</b>	<b>Status</b>	<b>Support</b>
S3.	Support P2PCD	8	O	O (following P2PCD features are conditional on this being implemented)
S3.1.	Number of supported SDEEs	8.2.6	S3.2: 1:O > 1:O	Minimum of 1
S3.2.	<b>Support SSME and SDS operations for P2PCD in the requester role</b>	8.2.4.1	S3:O30	Y
S3.2.1.	Under at least one condition, trigger request processing on receiving a trigger SPDU	8.2.4.1	S3.2:M	Enter description of at least one condition under which request processing is triggered ()
S3.2.2.	Do not trigger request processing on receiving a trigger SPDU for which a request is already active	8.2.4.1	S3.2:M	Y
S3.2.3.	Number of simultaneously active P2PCD learning requests	8.2.4.1	S3.2: 1:O > 1:O	At least 1
S3.2.4.	When request processing is triggered, include a P2PCD learning request in the next SPDU for the trigger SDEE except in the following exception cases	8.2.4.1	S3.2: M	Y
S3.2.4.1.	Do not include a P2PCD learning request if a learning request for the same certificate has been received within <b>p2pcd_observedRequestTimeout</b>	8.2.4.1	S3.2.4:O	Y
S3.2.4.2.	Only include one P2PCD learning request no matter how many learning requests have been triggered	8.2.4.1	S3.2.4: M	Y
S3.2.5.	Receive notifications from a P2PCDE that a P2PCD learning response has been received and use those to update the list of known certificates.	8.2.4.1	S3.2: M	Y
S3.3.	<b>Support SSME and SDS operations for P2PCD in the responder role</b>	8.2.4.2	S3:O30	Y
S3.3.1.	Trigger response processing on receiving a P2PCD learning request	8.2.4.2	S3.3:M	Y
S3.3.2.	Number of simultaneously active P2PCD learning responses	8.2.4.1	S3.3: 1:O > 1:O	Minimum of 1
S3.3.3.	Do not trigger response processing if less than <b>p2pcd_responseActiveTimeout</b> has passed since last triggered	8.2.4.2	S3.3: M	Y
S3.3.4.	Trigger sending response after random backoff time unless threshold number of responses have been observed	8.2.4.2	S3.3: M	Y
S3.3.5.	Increment number of responses observed based on input from P2PCDE	8.2.4.2	S3.3: M	Y

**Table 8 - IEEE 1609.2 peer to peer certificate distribution conformance statement (continued)**

Item	Security configuration (top-level)	Reference	Status	Support
S3.4.	<b>Support P2PCDE operations for P2PCD</b>	8.2.4.2	S3:O30	Y
S3.4.1.	Receive responses and provide to SSME	8.2.4.1, 8.2.4.2, 8.3.1	S1.1: M	Y
S3.4.2.	Send responses when triggered by SSME	8.2.4.2, 8.3.1	S1.1: O	Y
S3.4.3.	Send responses over WSMP	8.2.4.2	S3.4.2: M	Y

#### 6.1.2.2 BSM Security Profile Proforma (normative)

A Security Profile Proforma is provided in IEEE 1609.2 [3]. This profile is used to further state requirements for BSM transmissions on channel *vChannelNumber*. An example hexadecimal representation of a message based on this security profile and the corresponding ASN.1 is provided in Appendix 0.

##### 6.1.2.2.1 IEEE 1609.2 Security Profile Identification

- The System shall use the security profile identified in Table 9. [6.1.2-V2V-STD-1609.2-001]

**Table 9 - Security Profile Identification**

Field	Value	Notes
Name	Security Profile for BSMs transmitted on channel <i>vChannelNumber</i> for light vehicles	
PSIDs	0x20	
Other considerations	This security profile is to be used for BSMs transmitted on channel <i>vChannelNumber</i>	

##### 6.1.2.2.2 Sending

The System shall use the security profile for sending defined in Table 10 [6.1.2-V2V-STD-1609.2-002]

**Table 10 - Security Profile for Transmitting BSMs**

Field	Value	Notes
<i>Sign Data</i>	True	All BSMs are signed
<i>Signed Data In Payload</i>	True	BSM data is encapsulated in the signed data
<i>External Data</i>	False	No additional data is signed
<i>External Data Source</i>	False	
<i>External Data Hash Algorithm</i>	False	
<i>Set Generation Time In Security Headers</i>	True	Prevents replay attacks
<i>Set Generation Location In Security Headers</i>	False	Not necessary, already included in BSM
<i>Set Expiry Time In Security Headers</i>	False	Not necessary, application discards old messages
<i>Signed SPDU Lifetime</i>	N/A	
<i>Signer Identifier Policy Type</i>	Simple	See IEEE 1609.2 [3]
<i>Simple Signer Identifier Policy: Minimum Inter Cert Time</i>	$vMaxCertDigestInterval$	Attach certificates at a rate of $1/vMaxCertDigestInterval$
<i>Simple Signer Identifier Policy: Exceptions</i>	True	Use full certificate when an event flag in DE_VehicleEventFlags is set.
<i>Simple Signer Identifier Policy: Signer Identifier Cert Chain Length</i>	1	
<i>Text Signer Identifier Policy</i>	N/A	When sending certificates, send only the BSM signer certificate and not the CA certificates.
<i>Sign With Fast Verification</i>	Optional	Doesn't change signature
<i>EC Point Format</i>	Compressed	Reduces packet size. See IEEE 1609.2 [3]
<i>p2pcd_useInteractiveForm</i>	Optional	Items indented in the rows below only apply if this option is implemented.
<i>p2pcd_maxResponseBackoff</i>	$vP2pcd_maxResponseBackoff$	Wait no more than $vP2pcd_maxResponseBackoff$ seconds before deciding to send a response
<i>p2pcd_responseActiveTimeout</i>	$vP2pcd_responseActiveTimeout$	Send a response no more than $1/vP2pcd_responseActiveTimeout$ per second
<i>p2pcd_requestActiveTimeout</i>	$vP2pcd_requestActiveTimeout$	$vP2pcd_requestActiveTimeout$
<i>p2pcd_observedRequestTimeout</i>	$vP2pcd_observedRequestTimeout$	$vP2pcd_observedRequestTimeout$
<i>p2pcd_currentlyUsedTriggerCertificateTime</i>	$vP2pcd_currentlyUsedTriggerCertificateTime$	Response only to requests for certificates that have been used within the $vP2pcd_currentlyUsedTriggerCertificateTime$
<i>p2pcd_responseCountThreshold</i>	$vP2pcd_responseCountThreshold$	Respond only if fewer than $vP2pcd_responseCountThreshold$ responses were seen during the backoff time
<i>Repeat Signed SPDUs</i>	False	Each BSM is uniquely signed before transmission
<i>Time Between Signing</i>	N/A	
<i>Encrypt Data</i>	False	Encryption is not used for BSMs

#### 6.1.2.2.3 Receiving

When the System chooses to verify a received BSM, it shall use the security profile for receiving defined in Table 11 [6.1.2-V2V-STD-1609.2-003]

**Table 11 - Security profile for receiving BSMs**

Field	Value	Notes
<i>Use Preprocessing</i>	True	Store certificates even for messages that aren't being verified. Used to verify a digest.
<i>Verify Data</i>	True	
<i>Maximum Certificate Chain Length</i>	1	
<i>Relevance: Replay</i>	False	Application handles duplication within the Validity Period.
<i>Relevance: Generation Time in Past</i>	True	Guards against replay attacks.
<i>Validity Period</i>	30 seconds	Corresponds to the maximum value of +/-DE_DSecond/2
<i>Relevance: Generation Time in Future</i>	Yes	See IEEE 1609.2 [3]. Applies to messages newer than the Validity Period allows. Applications can filter messages inside the Validity Period.
<i>Acceptable Future Data Period</i>	30 seconds	Corresponds to +/- the maximum value of DE_DSecond/2
<i>Generation Time Source</i>	Security headers	See IEEE 1609.2 [3]
<i>Relevance: Expiry Time</i>	False	
<i>Expiry Time Source</i>	N/A	
<i>Consistency: Generation Location</i>	True	Use the position data from the BSM to compare to validity region.
<i>Relevance: Generation Location Distance</i>	False	
<i>Validity Distance</i>	N/A	
<i>Generation Location Source</i>	Payload	BSM
<i>Overdue CRL Tolerance</i>	3 years	Setting that corresponds to the number of certificates with which a system is initially equipped.
<i>Relevance: Certificate Expiry</i>	True	Default recommended in IEEE 1609.2 [3]
<i>Encrypted Data</i>	False	Encryption is not used for BSMs

#### 6.1.2.2.4 Security management

- The System shall comply with the Security Management profile defined in Table 12. [6.1.2-V2V-STD-1609.2-004]

**Table 12 - Security management profile**

Field	Value	Notes
<i>Signing Key Algorithm</i>	ECDSA-256	This is the only supported signing algorithm in this standard.
<i>Encryption Algorithm</i>	N/A	Encryption is not used for BSMs
<i>Implicit or Explicit Certificates</i>	Implicit	Reduces packet size. Reduces verification time for verification on demand (see 1609.2 [3]).
<i>EC Point Format</i>	Compressed	Reduces packet size.
<i>Supported Geographic Regions</i>	Identified Country only	U.S., Canada, Mexico Note: Any other geographic regions that choose to apply this standard will have to modify this item.
<i>Maximum Certificate Chain Length</i>	1	
<i>Use Individual Linkage ID</i>	True	Support privacy preserving revocation
<i>Use Group Linkage ID</i>	True	Support privacy preserving revocation
<i>Signature Algorithms in Chain or CRL</i>	ECDSA-256	This is the only supported signing algorithm in this (2945/1) standard.

#### 6.1.2.2.5 Other

Table 13 identifies security fields that may be subject to future policy updates.

**Table 13 - Fields Subject to Policy Updates**

Field	Value	Notes
Fields that may be subject to policy update	Overdue CRL Tolerance, Supported Geographic Regions, Use peer-to-peer certificate distribution, Signing Key algorithm, Signature Algorithms in Chain or CRL.	These fields may be updated by a SCMS in the future.

## 6.1.3 IEEE 1609.3 (1609.3)

This Section specifies the requirements from IEEE 1609.3 [4] to support V2V and SCMS operation, as described in Section 6.1. Using the PICS from IEEE 1609.3 [4] the profile for BSM transmissions on channel *vChannelNumber* is provided in this Section. Items left blank in the Support column are optional. Items marked V2V are required for transmitting and receiving signed BSMs, and items marked V2V may also be used for peer to peer certificate learning options in 6.1.2.2.2. Items marked SCMS are required only if interfacing to an SCMS over DSRC is supported. See 6.1.2.1 for further description regarding how to interpret an IEEE PICS.

- The DSRC Radio Subsystem shall comply with the V2V items identified in Table 14. If values are specified in the table, the items are set as stated. [6.1.3-V2V-STD-1609.3-001]
- If the System supports interfacing to an SCMS over DSRC, the DSRC Radio Subsystem shall comply with the SCMS items identified in Table 14. [6.1.3-V2V-STD-1609.3-002]

**Table 14 - IEEE 1609.3 requirements (PICS Proforma)**

Item	Feature	Value	Reference	Status	Support
N1	<b>DATA PLANE</b>	—	—	—

#### 6.1.4 IEEE 1609.4 (1609.4)

This Section specifies the requirements from IEEE 1609.4 [5] to support V2V and SCMS operation, as described in Section 6.1. Using the Protocol Implementation Conformance Statement from IEEE 1609.4 [5] the profile for BSM transmissions on channel *vChannelNumber* is provided in this Section. Items left blank in the support column are not identified for use by this standard. Items marked V2V are required for transmitting and receiving BSMs, and items marked SCMS are required only if interfacing to an SCMS over DSRC is supported. See 6.1.2.1 for further description regarding how to interpret an IEEE PICS.

- The DSRC Radio Subsystem shall comply with the V2V items identified in Table 15. If values are specified in the table, the items are set as stated [0-V2V-STD-1609.4-001].
- If the System supports interfacing to an SCMS over DSRC, the DSRC Radio Subsystem shall comply with the SCMS items identified in Table 15. [0-V2V-STD-1609.4-002]

**Table 15 - IEEE 1609.4 requirements (PICS Proforma)**

Item	Feature	Value	Reference	Status	Support

### 6.1.5 IEEE 1609.12 (1609.12)

This Section specifies the requirements from IEEE 1609.12 [6] to support V2V and SCMS operation, as described in Section 6.1.

**Table 16 - IEEE 1609.12 requirements**

1609.12 Clause	Title (1609.12 Clause)	Required For	Requirement
4	WAVE Identifiers		
4.1.x	Provider service identifier (PSID)	V2V	The System shall set the PSID value to the value assigned to "vehicle to vehicle safety and awareness" as specified. [6.1.5-V2V-STD-1609.12-001]
4.1.x	Provider service identifier (PSID)	SCMS	The System shall set the PSID value the value assigned to "WAVE security management" as specified. [6.1.5-V2V-STD-1609.12-002]
4.3	Ethertype	V2V	The System shall set the EtherType value for WSMP as specified. [6.1.5-V2V-STD-1609.12-003]
4.3	Ethertype	SCMS	The System shall set the EtherType value for IPv6 as specified. [6.1.5-V2V-STD-1609.12-004]

### 6.1.6 SAE J2735 (J2735)

This Section identifies the BSM data frames and data elements used in this standard. All requirements in Table 17 refer to SAE J2735 unless otherwise noted. The functional and performance requirements corresponding to these data frames and data elements are specified in Sections 0 through 6.6 of this standard.

**Table 17 - SAE J2735 Requirements**

Title (J2735 Clause)	Requirement
Message Encoding	The System shall conform to the ASN.1 representation of the Basic Safety Message as specified. [6.1.6-V2V-STD-J2735-001]
MSG_MessageFrame	
Data Element: DE_DSRC_MessageID	The System shall conform to the data element DE_DSRC_MessageID, as specified. [6.1.6-V2V-STD-J2735-002]
Message: MSG_BasicSafetyMessage (BSM)	The System shall conform to Part I of the Basic Safety Message, as specified. [6.1.6-V2V-STD-J2735-003]
Message: MSG_BasicSafetyMessage (BSM)	The System shall conform to Part II of the Basic Safety Message as specified in J2735 [1], this table and Section 6.3 of this standard. [6.1.6-V2V-STD-J2735-004]

***Table 17 - SAE J2735 Requirements (continued)***

Title (J2735 Clause)	Requirement
Data Frames	Note: The System includes the Data Frames required for Part I and Part II in the Basic Safety Message as specified in J2735 [1], this table and Section 6.3 of this standard
Data Frame: DF_AccelerationSet4Way	The System shall conform to DF_AccelerationSet4Way, as specified. [6.1.6-V2V-STD-J2735-005]
Data Frame: DF_BrakeSystemStatus	The System shall conform to DF_BrakeSystemStatus, as specified. [6.1.6-V2V-STD-J2735-006]
Data Frame: DF_BSMcoreData	The System shall conform to DF_BSMcoreData, as specified. [6.1.6-V2V-STD-J2735-007]
Data Frame: DF_PathHistory	The System shall conform to DF_PathHistory, as specified. [6.1.6-V2V-STD-J2735-008]
Data Frame: DF_PathHistoryPointList	The System shall conform to DF_PathHistoryPointList, as specified. [6.1.6-V2V-STD-J2735-009]
Data Frame: DF_PathHistoryPoint	The System shall conform to DF_PathHistoryPoint, as specified. [6.1.6-V2V-STD-J2735-010]
Data Frame: DF_PathPrediction	The System shall conform to DF_PathPrediction, as specified. [6.1.6-V2V-STD-J2735-011]
Data Frame: DF_PositionalAccuracy	The System shall conform to DF_PositionalAccuracy, as specified. [6.1.6-V2V-STD-J2735-012]
Data Frame: DF_VehicleSafetyExtensions	The System shall conform to DF_VehicleSafetyExtensions, as specified. [6.1.6-V2V-STD-J2735-013]
Data Frame: DF_VehicleSize	The System shall conform to DF_VehicleSize. [6.1.6-V2V-STD-J2735-014]
Data Elements	Note: The System includes the Data Elements from Part I and Part II of the Basic Safety Message, as specified in J2735 [1], this table, and Section 6.3 of this standard.
Data Element: DE_Acceleration	The System shall conform to DE_Acceleration, as specified. [6.1.6-V2V-STD-J2735-015]
Data Element: DE_AntiLockBrakeStatus	The System shall conform to DE_AntiLockBrakeStatus, as specified. [6.1.6-V2V-STD-J2735-016]
Data Element: DE_AuxiliaryBrakeStatus	The System shall conform to DE_AuxiliaryBrakeStatus, as specified. [6.1.6-V2V-STD-J2735-017]
Data Element: DE_BrakeAppliedStatus	The System shall conform to DE_BrakeAppliedStatus, as specified. [6.1.6-V2V-STD-J2735-018]
Data Element: DE_BrakeBoostApplied	The System shall conform to DE_BrakeBoostApplied, as specified. [6.1.6-V2V-STD-J2735-019]
Data Element: DE_Confidence	The System shall conform to DE_Confidence, as specified. [6.1.6-V2V-STD-J2735-020]
Data Element: DE_DSecond	The System shall conform to DE_DSecond, as specified. [6.1.6-V2V-STD-J2735-021]
Data Element: DE_Elevation	The System shall conform to DE_Elevation, as specified. [6.1.6-V2V-STD-J2735-022]
Data Element: DE_ExteriorLights	When DE_ExteriorLights is included in the BSM, the System shall conform to DE_ExteriorLights, as specified. [6.1.6-V2V-STD-J2735-023]
Data Element: DE_Heading	The System shall conform to DE_Heading, as specified. [6.1.6-V2V-STD-J2735-024]
Data Element: DE_Latitude	The System shall conform to DE_Latitude, as specified. [6.1.6-V2V-STD-J2735-025]
Data Element: DE_Longitude	The System shall conform to DE_Longitude, as specified. [6.1.6-V2V-STD-J2735-026]
Data Element: DE_MsgCount	The System shall conform to DE_MsgCount, as specified. [6.1.6-V2V-STD-J2735-027]
Data Element: DE_OffsetLL-B18	The System shall conform to DE_OffsetLL-B18, as specified. [6.1.6-V2V-STD-J2735-028]

***Table 17 - SAE J2735 Requirements (continued)***

Title (J2735 Clause)	Requirement
Data Element: DE_RadiusOfCurvature	The System shall conform to DE_RadiusOfCurvature, as specified. [6.1.6-V2V-STD-J2735-029]
Data Element: DE_SemiMajorAxisAccuracy	The System shall conform to DE_SemiMajorAxisAccuracy, as specified. [6.1.6-V2V-STD-J2735-030]
Data Element: DE_SemiMajorAxisOrientation	The System shall conform to DE_SemiMajorAxisOrientation, as specified. [6.1.6-V2V-STD-J2735-031]
Data Element: DE_SemiMinorAxisAccuracy	The System shall conform to DE_SemiMinorAxisAccuracy, as specified. [6.1.6-V2V-STD-J2735-032]
Data Element: DE_Speed	The System shall conform to DE_Speed, as specified. [6.1.6-V2V-STD-J2735-033]
Data Element: DE_StabilityControlStatus	The System shall conform to DE_StabilityControlStatus, as specified. [6.1.6-V2V-STD-J2735-034]
Data Element: DE_SteeringWheelAngle	The System shall conform to DE_SteeringWheelAngle, as specified. [6.1.6-V2V-STD-J2735-035]
Data Element: DE_TemporaryID	The System shall conform to DE_TemporaryID, as specified. [6.1.6-V2V-STD-J2735-036]
Data Element: DE_TimeOffset	The System shall conform to DE_TimeOffset, as specified. [6.1.6-V2V-STD-J2735-037]
Data Element: DE_TractionControlStatus	The System shall conform to DE_TractionControlStatus, as specified. [6.1.6-V2V-STD-J2735-038]
Data Element: DE_TransmissionState	The System shall conform to DE_TransmissionState, as specified. [6.1.6-V2V-STD-J2735-039]
Data Element: DE_VehicleEventFlags	When DE_VehicleEventFlags is included in the BSM, the System shall conform to DE_VehicleEventFlags as specified in J2735 [1] and this standard. [6.1.6-V2V-STD-J2735-040]
Data Element: DE_VehicleLength	The System shall conform to DE_VehicleLength, as specified. [6.1.6-V2V-STD-J2735-041]
Data Element: DE_VehicleWidth	The System shall conform to DE_VehicleWidth, as specified. [6.1.6-V2V-STD-J2735-042]
Data Element: DE_VerticalAcceleration	The System shall conform to DE_VerticalAcceleration, as specified. [6.1.6-V2V-STD-J2735-043]
Data Element: DE_VertOffset-B12	The System shall conform to DE_VertOffset-B12, as specified. [6.1.6-V2V-STD-J2735-044]
Data Element: DE_YawRate	The System shall conform to DE_YawRate, as specified. [6.1.6-V2V-STD-J2735-045]

#### 6.1.7 FCC 47 CFR, Parts 0, 1, 2, and 95 (Informative)

Regulatory requirements for the DSRC Radio Subsystem within the United States are available from the Federal Communications Commission (FCC), Title 47 of the Code of Federal Regulations (CFR), Parts 0, 1, 2, and 95.

NOTE: Regulatory domains outside the United States may be subject to different regulatory requirements. FCC type certifications are required in the United States as defined in the CFR.

## 6.2 Positioning and Timing Requirements (POSTIM)

### 6.2.1 Position Determination (POSDETER)

- The Positioning Subsystem shall include a GNSS receiver. In the United States this requires that the GNSS receiver includes GPS. [6.2.1-V2V-POSTIM-POSDETER-001]

NOTE: Additional positioning and augmentation capabilities can be used.

- The System shall determine the position<sup>4</sup> of the vehicle as defined in 6.2.3 at a nominal rate of  $vPosDetRate$  and the Coordinated Universal Time (UTC) when at that position. [6.2.1-V2V-POSTIM-POSDETER-002]

NOTE: In order to send a position estimate that is more recent than that provided by the Positioning Subsystem, the System can estimate vehicle position at the current time, for example using the method described in Appendix A.3. DE\_DSecond represents the time at which position and positional accuracy were determined (see 6.3.6.4).

NOTE: Position and UTC are estimates and are subject to the accuracy requirements in 6.3.6.4, 0 and 6.3.6.6.

### 6.2.2 Wide Area Augmentation System (WAAS)

- The Positioning Subsystem shall use WAAS corrections, when the WAAS signal is available to the Subsystem, in order to improve the position accuracy. If the WAAS signal is not available to the Positioning Subsystem, the GNSS and other sensors can still be used. [6.2.2-V2V-POSTIM-WAAS-001]

NOTE: This requirement establishes a minimum requirement for common source of positional corrections used by the GNSS receivers in V2V systems and provides better accuracy of the resulting relative position between vehicles. Additional augmentation and correction systems may be used in addition to WAAS.

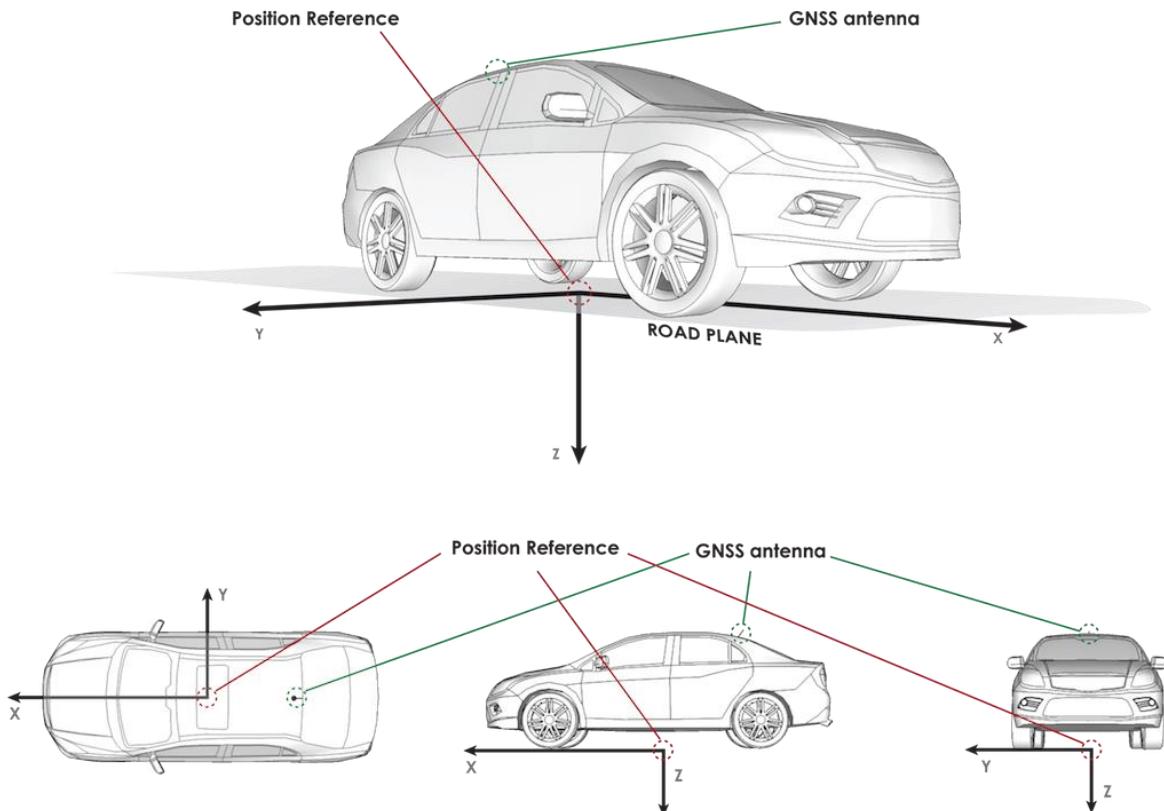

### 6.2.3 Coordinate System and Reference (COORDSYSREF)

The vehicle position (Position Reference) reported in a BSM shall be a point (latitude, longitude and elevation) projected onto the surface of the roadway (road plane) with reference to the WGS-84 coordinate system and its reference ellipsoid. This point is the center of the rectangle on the road plane, oriented about the vehicle that encompasses the farthest forward, rearward, and side-to-side points on the vehicle, including original equipment such as outside side view mirrors (see Figure 21). [6.2.3-V2V-POSTIM-COORDSYSREF-001]

NOTE: The GNSS antenna position is not the same as the Position Reference. See Appendix A.4 for an example of how to translate from the position of the GNSS antenna to the Position Reference. Incline of the road results in negligible change in Position Reference, but testing can be done under flat road test conditions (grade < 0.2% and cross-slope < 2%) to avoid introducing related biases during the test.

---

<sup>4</sup> Position is based on the position estimate provided by the Positioning Subsystem and any additional sensors. The method of computation of position estimates is outside the scope of this standard.

**Figure 21 - BSM position reference**

#### 6.2.4 System Time Coordination (SYSTIMCOORD)

- The System shall include a reference clock with an output that conforms to UTC 0. [6.2.4-V2V-POSTIM-SYSTIMCOORD-001]
- The UTC-conformant output of the reference clock shall be accurate to within *vTimeAccuracy* of the UTC reference. [6.2.4-V2V-POSTIM-SYSTIMCOORD-002]
- The System shall determine the time at which position is determined, using the UTC-conformant reference. [6.2.4-V2V-POSTIM-SYSTIMCOORD-003]

NOTE: The System has time (DE\_DSecond) synchronized to UTC in order to support position and time extrapolation, and security requirements. The System may implement the reference clock using the GNSS receiver and the corresponding one pulse per second (1PPS).

#### 6.3 BSM Transmission Requirements on Channel vChannelNumber (BSMTX)

##### 6.3.1 BSM Contents (BSMCONT)

- If the BSM meets the minimum criteria for BSM transmission specified in Table 19 and Table 20, the BSM shall be transmitted using a WAVE Short Message as defined in 1609.3 [4] and Section 6.1.3, and according to the timing requirements in 6.3.3 and 6.3.8. [6.3.1-V2V-BSMTX-BSMCONT-001]
- When transmitting a BSM, the System shall generate the corresponding MSG\_MessageFrame containing MSG\_BasicSafetyMessage and the data frames and data elements as specified in this standard and SAE J2735 [1]. [6.3.1-V2V-BSMTX-BSMCONT-002]

- All BSMs contain the BSM Part I content as specified in SAE J2735 [1]. The System shall include additional BSM content as follows:
    - The System transmitting a BSM shall include the DF\_VehicleSafetyExtensions data frame in Part II. [6.3.1-V2V-BSMTX-BSMCONT-003]
    - The DF\_VehicleSafetyExtensions data frame shall include:
      - DF\_PathHistory
      - DF\_PathPrediction
- [6.3.1-V2V-BSMTX-BSMCONT-004]

- The DF\_VehicleSafetyExtensions data frame shall include DE\_ExteriorLights only if one or more bits in the data element are set. [6.3.1-V2V-BSMTX-BSMCONT-005]
- If one or more event conditions corresponding to an event flag is met, the BSM Part II shall include the DF\_VehicleSafetyExtensions data element, DE\_VehicleEventFlags. DE\_VehicleEventFlags is not included if no event flags are set. [6.3.1-V2V-BSMTX-BSMCONT-006]

NOTE: Vehicle type (DE\_VehicleType) is omitted from BSM Part II for light vehicles. However, it can be inferred for light vehicles as long as all other classes of vehicles include the field in their BSMs as defined in future revisions of this standard, or in other standards in the SAE J2945 family of standards.

NOTE: J2735 [1] specifies that each BSM is encoded using Unaligned Packed Encoding Rules (UPER)

### 6.3.2 Channel and Data Rate (CHDATARATE)

- The System shall transmit BSMs on channel *vChannelNumber* with 10 MHz channel spacing (see 802.11 [2]). [6.3.2-V2V-BSMTX-CHDATARATE-001]
- The System shall transmit BSMs using an 802.11 [2] data rate of *vDataRate*. [6.3.2-V2V-BSMTX-CHDATARATE-002]

### 6.3.3 Generation of the First BSM after System Device Startup and Generation Timing (GENTIM)

The timing requirements in this Section apply only if the BSM meets the minimum criteria for BSM transmission specified in Table 19 and Table 20. Refer to 6.3.5 for behavior when the BSM does not meet the minimum transmission criteria.

- After System device startup, generation of the first BSM shall have a random start time. The start time is the basis for the computational intervals used in 6.3.8 and shown in Figure 22. [6.3.3-V2V-BSMTX-GENTIM-001]
- After the first BSM generated after System device startup, the System shall generate each subsequent BSM within  $-vBSMRateTolerance$  and  $+vBSMRateTolerance$  of its scheduled generation time. [6.3.3-V2V-BSMTX-GENTIM-002]

NOTE: In 802.11-based systems, there may be a relatively small non-deterministic queuing delay between the time at which a packet is generated, and the time at which it is transmitted. Hence, this standard uses “generate” in place of “transmit” where MAC queuing can introduce small latencies between the time the BSM is formed and its transmission. Queuing performance within the 802.11 MAC is outside the scope of this standard, but if System tests related to BSM generation requirements are performed by testing a System’s BSM transmissions without the presence of BSM transmissions from other Systems, 802.11 MAC performance has a negligible impact on the test results.

### 6.3.4 User Priority and EDCA Settings (UPEDCA)

- The System shall set the User Priority field defined in 802.11 [2] to 5 for BSMs with no Critical Event Flags. [0-V2V-BSMTX-UPEDCA-001]
- The System shall set the User Priority field defined in 802.11 [2] to 7 for BSMs that include one or more Critical Event Flags. [0-V2V-BSMTX-UPEDCA-002]
- The System shall set the EDCA parameters defined in 802.11 [2] as shown in Table 18 for BSM transmissions on channel *vChannelNumber*. [0-V2V-BSMTX-UPEDCA-003]

**Table 18 - EDCA parameter set**

User Priority	AC	CWmin	CWmax	AIFSN	TXOP Limit OFDM/CCKOFDM PHY
1, 2	AC_BK	15	1023	9	0
0, 3	AC_BE	15	1023	6	0
4, 5	AC_VI	15	1023	4	0
6, 7	AC_VO	3	7	2	0

NOTE: The CWmin and AIFSN values for AC\_VI are different than the default EDCA parameter set when dot11OCBActivated is equal to true (see 802.11 [2]). AIFSN was changed from a default of 3 to 4, CWmin was changed from a default of 7 to 15, and CWmax was changed from a default of 15 to 1023. These changes improve throughput for BSMs and prioritize BSMs over other potential background and best-effort messages on the same channel.

### 6.3.5 Minimum Transmission Criteria (MINTX)

- The System shall transmit a BSM only if the BSM meets the minimum criteria for BSM transmission specified in Table 19 and Table 20. If at any time the System cannot formulate a BSM that meets the minimum transmission criteria, the System ceases transmitting BSMs until the criteria are met. [6.3.5-V2V-BSMTX-MINTX-001]

**Table 19 - BSM Part I: Minimum criteria for BSM transmission**

Data Element/Field	Can be set to unavailable, or represent an unknown value, as specified in J2735 [1]?	Section Reference (this standard)
DE_DSRC_MessageID	No	6.3.6.1
DE_MsgCount	No	6.3.6.2
DE_TemporaryID	No	6.3.6.3
DE_DSecond	No	6.3.6.4
DE_Latitude	No	0
DE_Longitude	No	0
DE_Elevation	No	6.3.6.6
DF_PositionalAccuracy	No	6.3.6.7
DE_SemiMajorAxisAccuracy	No	6.3.6.7
DE_SemiMinorAxisAccuracy	No	6.3.6.7
DE_SemiMajorAxisOrientation	No	6.3.6.7

**Table 19 - BSM Part I: Minimum criteria for BSM transmission (continued)**

Data Element/Field	Can be set to unavailable, or represent an unknown value, as specified in J2735 [1]?	Section Reference (this standard)
DE_Speed	No	6.3.6.8
DE_TransmissionState	Yes	6.3.6.9
DE_Heading	No	0
DE_SteeringWheelAngle	Yes	6.3.6.11
DF_AccelerationSet4Way		
DE_Acceleration (Longitudinal)	No	6.3.6.12
DE_Acceleration (Lateral)	Yes	6.3.6.12
DE_VerticalAcceleration	Yes	6.3.6.12
DE_YawRate	No	6.3.6.12
DF_BrakeSystemStatus	Yes  Note: All parameters in DF_BrakeSystemStatus may be set to Unavailable.	6.3.6.13
DF_VehicleSize		
DE_VehicleWidth	No	6.3.6.14
DE_VehicleLength	No	6.3.6.14

**Table 20 - BSM Part II: Minimum criteria for BSM transmission**

Data Element/Field	Can a BSM be transmitted without the Data Frame/Element?	Notes	Section Reference (this standard)
DE_VehicleEventFlags	Yes	DE_VehicleEventFlags is not included in the BSM if no event conditions are met	6.3.6.15
DF_PathHistory	No	A BSM cannot be transmitted without DF_PathHistory	6.3.6.16
DF_PathPrediction	No	A BSM cannot be transmitted without DF_PathPrediction	6.3.6.17
DE_ExteriorLights	Yes	DE_ExteriorLights is not included in the BSM if the corresponding status is unavailable or the exterior lights are turned off	6.3.6.18

### 6.3.6 Data Element Accuracy (DATAACC)

#### 6.3.6.1 DE\_DSRC\_MessageID

- The System shall set the DE\_DSRC\_MessageID to the value assigned to basicSafetyMessage. (see SAE J2735 [1]). [6.3.6-V2V-BSMTX-DATAACC-001]

#### 6.3.6.2 DE\_MsgCount

- The System shall initialize the DE\_MsgCount to a random value within the range defined by SAE J2735 [1] when sending the first BSM after System device startup. [6.3.6-V2V-BSMTX-DATAACC-002]
- If the certificate used to sign the BSM has changed since transmitting the most recent BSM, the System shall re-initialize the DE\_MsgCount field to a new random value within the range defined by SAE J2735 [1] before transmitting the next BSM. [6.3.6-V2V-BSMTX-DATAACC-003]
- The System shall set DE\_MsgCount equal to one greater than the value used in the previously transmitted BSM, according to SAE J2735 [1] if the certificate used to sign the BSM has not changed since sending the most recent BSM. For this element the value after 127 is 0 per J2735 [1]. [6.3.6-V2V-BSMTX-DATAACC-004]

NOTE: DE\_MsgCount, DE\_TemporaryID and the DSRC Radio Subsystem MAC address are each randomly reinitialized when the security certificate changes.

#### 6.3.6.3 DE\_TemporaryID

- The System shall initialize the DE\_TemporaryID to a random value expressable within the range defined by SAE J2735 [1] for the first BSM generated after System device startup. [6.3.6-V2V-BSMTX-DATAACC-005]
- If the certificate used to sign the BSM has changed since transmitting the most recent BSM, the System shall re-initialize the DE\_TemporaryID to a new random value within the range defined by SAE J2735 [1] before transmitting the next BSM. [6.3.6-V2V-BSMTX-DATAACC-006]
- The System shall not change DE\_TemporaryID if the certificate has not changed. [6.3.6-V2V-BSMTX-DATAACC-007]

NOTE: DE\_MsgCount, DE\_TemporaryID and the DSRC Radio Subsystem MAC address are each randomly reinitialized when the security certificate changes.

#### 6.3.6.4 DE\_DSecond

- The System shall set the DE\_DSecond as specified in SAE J2735 [1], using UTC as the time of reference. [6.3.6-V2V-BSMTX-DATAACC-008]
- The time represented by the value of DE\_DSecond shall be the time from the reference clock (6.2.3) at which the vehicle position data contained in the BSM Part I (0 and 6.3.6.6) was determined by the System. [6.3.6-V2V-BSMTX-DATAACC-009]
- In order to ensure the transmitted information is current, the difference between UTC at which the BSM is generated and the time represented by the value of DE\_DSecond shall be less than vMaxPosAge. [6.3.6-V2V-BSMTX-DATAACC-010]

NOTE: The result of this requirement is that BSMs do not contain information that is older than UTC minus vMaxPosAge.

NOTE: SAE J2735 [1] states in a remark that other measurements present in the BSM are aligned to DE\_DSecond insofar as possible in the implementation. Practical implementations to date have used the most recent measurement updates known to the transmitter at the time when the BSM is composed.

### 6.3.6.5 DE\_Latitude & DE\_Longitude

- The System shall set the DE\_Latitude and DE\_Longitude data elements to its corresponding two-dimensional (2-D) horizontal Position Reference in the WGS-84 coordinate system. [6.3.6-V2V-BSMTX-DATAACC-011]
- The position of the System transmitting a BSM shall be accurate to within *vPosAccuracy* of the vehicle's actual 2-D horizontal Position Reference over 68% of test measurements under Open Sky Test Conditions. See Appendix 0 for the definition of Open Sky Test Conditions. [6.3.6-V2V-BSMTX-DATAACC-012]

NOTE: The intent of the requirements is for the position to be accurate enough to support safety applications requiring lane-level accuracy. The accuracy requirement is based on the minimum Federal Highway Administration (FHWA) recommended width (3.0 meters) of any roadway equal to or wider than a collector roadway 0. The 68% accuracy requirement under Open Sky Test Conditions results in 95% confidence for relative positioning with lane-level granularity, based on testing done to support the use cases described in Section 4.

### 6.3.6.6 DE\_Elevation

- The System shall set the DE\_Elevation data element to its corresponding elevation ("Height above Reference Ellipsoid") of the Position Reference, above or below the WGS-84 reference ellipsoid. [6.3.6-V2V-BSMTX-DATAACC-013]
- The DE\_Elevation data element shall be accurate to within *vElevAccuracy* of the actual elevation over 68% of test measurements, under Open Sky Test Conditions. See Appendix 0 or the definition of Open Sky Test Conditions. [6.3.6-V2V-BSMTX-DATAACC-014]

NOTE: The 68% accuracy requirement under Open Sky Test Conditions results in 95% confidence for relative positioning with lane-level granularity, based on testing done to support the use cases described in Section 4.

### 6.3.6.7 DF\_PositionalAccuracy

- The System shall set the values in the DF\_PositionalAccuracy data frame of the BSM with values corresponding to its accuracy estimate for the vehicle position data included in the corresponding BSM. The methodology for estimating positional accuracy (confidence) is outside the scope of this standard. [6.3.6-V2V-BSMTX-DATAACC-015]
- DF\_PositionalAccuracy shall provide the DE\_SemiMajorAxisAccuracy and DE\_SemiMinorAxisAccuracy of the error ellipsoid at one standard deviation, as well as the DE\_SemiMajorAxisOrientation for the semi-major axis. [6.3.6-V2V-BSMTX-DATAACC-016]

### 6.3.6.8 DE\_Speed

- The DE\_Speed data element in this data frame shall be accurate to within *vSpeedAccuracy* of the actual vehicle speed over 68% of test measurements, under Open Sky Test Conditions. [6.3.6-V2V-BSMTX-DATAACC-017]

NOTE: See Appendix 0 for the definition of Open Sky Test Conditions.

### 6.3.6.9 DE\_TransmissionState

- The DE\_TransmissionState data element shall correctly reflect the state of the vehicle's transmission. [6.3.6-V2V-BSMTX-DATAACC-018]

### 6.3.6.10 DE\_Heading

- DE\_Heading shall describe the direction of the vehicle reference point, and its value increases clockwise from north. [6.3.6-V2V-BSMTX-DATAACC-019]
- DE\_Heading shall be accurate to within  $vHeadAccuracyB$  of the actual vehicle heading over 68% of test measurements when the vehicle speed is less than or equal to  $vHeadingSpeedThresh$  under Open Sky Test Conditions. [6.3.6-V2V-BSMTX-DATAACC-020]
- DE\_Heading shall be accurate to within  $vHeadAccuracyA$  of the actual vehicle heading over 68% of test measurements when the vehicle speed is greater than  $vHeadingSpeedThresh$  under Open Sky Test Conditions. [6.3.6-V2V-BSMTX-DATAACC-021]
- The System shall latch the value of DE\_Heading to the last known heading value when the speed was above  $vHeadLatchThresh$  when the vehicle speed drops below  $vHeadLatchThresh$ . [6.3.6-V2V-BSMTX-DATAACC-022]
- The System shall unlatch the value of DE\_Heading when the vehicle speed exceeds  $vHeadUnlatchThresh$ . [6.3.6-V2V-BSMTX-DATAACC-023]

NOTE: See Appendix 0 for the definition of Open Sky Test Conditions.

### 6.3.6.11 DE\_SteeringWheelAngle

- If the DE\_SteeringWheelAngle is used, it shall be accurate to within  $vStWhAnAccuracy$  of the actual vehicle steering wheel angle over 95% of test measurements, or DE\_SteeringWheelAngle is set to unavailable. [6.3.6-V2V-BSMTX-DATAACC-024]

NOTE: This information is available from the vehicle CAN bus or other vehicle interface.

### 6.3.6.12 DF\_AccelerationSet4Way

- The DE\_Acceleration (Longitudinal) and DE\_Acceleration (Lateral) data elements in this data frame shall be accurate to within  $vAccelAccuracy$  of the actual vehicle longitudinal and lateral accelerations, respectively, over 68% of test measurements under Open Sky Test Conditions and flat road test conditions (grade < 0.2% and cross-slope < 2%). [6.3.6-V2V-BSMTX-DATAACC-025]
- The DE\_VerticalAcceleration data element in this data frame shall be accurate to within  $vVertAccelAccuracy$  of the actual vehicle vertical acceleration over 68% of test measurements under Open Sky Test Conditions and flat road test conditions (grade < 0.2% and cross-slope < 2%). [6.3.6-V2V-BSMTX-DATAACC-026]
- The DE\_YawRate data element in this data frame shall be accurate to within  $vYawRateAccuracy$  of the actual vehicle yaw rate over 68% of test measurements under Open Sky Test Conditions and flat road test conditions (grade < 0.2% and cross-slope < 2%). [6.3.6-V2V-BSMTX-DATAACC-027]

NOTE: See Appendix 0 for the definition of Open Sky Test Conditions.

### 6.3.6.13 DF\_BrakeSystemStatus

- If available, the System shall use the vehicle bus as the data source for DF\_BrakeSystemStatus. [6.3.6-V2V-BSMTX-DATAACC-028]
- When braking status for each wheel is available, the System shall set each bit in the wheelBrakes field to 1 (= true) or 0 (= false) based on the brake status for the corresponding wheel, and set the wheelBrakesUnavailable field to 0 (= false). [6.3.6-V2V-BSMTX-DATAACC-029]
- If only one braking status indication is available (individual wheel status not available), the System shall set the bits for all wheels in the wheelBrakes field on or off depending on the braking status and set the wheelBrakesUnavailable field to 0 (= false). [6.3.6-V2V-BSMTX-DATAACC-030]

- When no braking status is available, the System shall set the wheelBrakesUnavailable field to 1 (= true). [6.3.6-V2V-BSMTX-DATAACC-031]
- The System shall set the traction, abs, scs, brakeBoost, and auxBrakes fields in accordance with SAE J2735 [1]. [6.3.6-V2V-BSMTX-DATAACC-032]

#### 6.3.6.14 DF\_VehicleSize

- The accuracy of DE\_VehicleLength and DE\_VehicleWidth data elements in this data frame shall be accurate to within  $vSizeAccuracy$  of the actual vehicle length and vehicle width, respectively. [6.3.6-V2V-BSMTX-DATAACC-033]

#### 6.3.6.15 DE\_VehicleEventFlags

- The difference between the time at which a Critical Event Condition is initially met (see SAE J2735 [1]) and the time of generation of the initial BSM with the corresponding DE\_VehicleEventFlags bit set shall be less than  $vEventDetectLatency$ . This requirement still holds if a different Critical Event Condition was already ongoing. [6.3.6-V2V-BSMTX-DATAACC-034]
- The System shall set the Hard Braking event flag when the corresponding event condition is met (see SAE J2735 [1]). If the information is available, the System sets the ABS, Traction Control, and Stability Control Critical Event Flags when the corresponding Critical Event Conditions occur, and the System may support other event flags. [6.3.6-V2V-BSMTX-DATAACC-035]

#### 6.3.6.16 DF\_PathHistory

- The System shall populate DF\_PathHistory in the BSM Part II DF\_VehicleSafetyExtensions data frame as follows:
  - crumbData: DF\_PathHistoryPointList [6.3.6-V2V-BSMTX-DATAACC-036]
  - Within the DF\_PathHistoryPointList, the System shall populate the DF\_PathHistoryPoint data frame with the following data elements :
    - latOffset: DE\_OffsetLL-B18
    - lonOffset: DE\_OffsetLL-B18
    - elevationOffset: DE\_VertOffset-B12
    - timeOffset: DE\_TimeOffset
- DF\_PathHistory and DF\_PathHistoryPoint shall not include any additional data elements or frames within the BSMs transmitted on channel  $vChannelNumber$ . [6.3.6-V2V-BSMTX-DATAACC-038]
- The System shall populate DF\_PathHistory with Path History (PH) points so that the represented PH distance (i.e., the distance between the first and last PH point along the vehicle path) is at least  $vMinPHistDistance$  and no more than  $vMaxPHistDistance$  unless initially, or due to the unavailability of position, there is less than  $vMinPHistDistance$  of PH. [6.3.6-V2V-BSMTX-DATAACC-039]

**NOTE:** DF\_PathHistory contains five points or fewer ( $\leq 40$  bytes prior to UPER encoding) 91.3% of the time based on extensive testing.

- The System shall maintain a vehicle path comprised of data elements derived from the Positioning Subsystem sampled at a periodic time interval (typically the same as the rate of BSM transmissions) representing the vehicle's recent movement over a corresponding distance. [6.3.6-V2V-BSMTX-DATAACC-040]

- The System shall populate DF\_PathHistory with PH points such that the perpendicular distance between any point on the vehicle path and the straight line connecting two adjacent PH points is less than  $vPathPerpendicularDist$ . [6.3.6-V2V-BSMTX-DATAACC-041]
- The System shall populate DF\_PathHistory with the minimum number of PH points, selected as a subset of the available vehicle path position data, necessary to satisfy  $vPathPerpendicularDist$  and  $vMinPHistDistance$ . [6.3.6-V2V-BSMTX-DATAACC-042]
- The System shall populate DF\_PathHistory with time-ordered PH points, with the first PH point being the closest in time to the current UTC time. [6.3.6-V2V-BSMTX-DATAACC-043]

NOTE: Time-ordered PH points are not required to be spaced equally in time.

- If the number of PH points needed to meet the requirements previously stated in this Section exceeds  $vMaxPHistPoints$ , the System shall populate DF\_PathHistory with not more than  $vMaxPHistPoints$  points from the computed set of points (effectively the distance requirement is relaxed). [6.3.6-V2V-BSMTX-DATAACC-044]

NOTE: An example PH algorithm is provided in Method One of Appendix A.5.

#### 6.3.6.17 DF\_PathPrediction

- The System shall populate the DF\_PathPrediction data frame in the BSM Part II DF\_VehicleSafetyExtensions data frame as follows:
  - DE\_RadiusOfCurvature
  - DE\_Confidence[6.3.6-V2V-BSMTX-DATAACC-045]
- The System shall populate DF\_PathPrediction with a calculated radius that has less than  $vPPredRadiusError$  error from the actual radius when the vehicle is in steady state conditions over a range from  $vMinCurveRadius$  to  $vMaxCurveRadius$ . [6.3.6-V2V-BSMTX-DATAACC-046]

NOTE: For the purposes of Path Prediction (PP), steady state conditions occur when the vehicle is driving on a curve with a constant radius. In steady state the average of the absolute value of the change of yaw rate over time is smaller than 0.5 deg/s<sup>2</sup>.

- The System shall repopulate DF\_PathPrediction after a transition from a constant radius of curvature (R1) to a new constant radius of curvature (R2) within  $vPPredTransitionTime$  under the maximum allowable error bound defined in 6.3.6-V2V-BSMTX-DATAACC-046. [6.3.6-V2V-BSMTX-DATAACC-047]
- The System shall report a “straight path” radius of value 32,767 and confidence of value 100% (corresponds to a value of 200 for the data element) when the transmitting vehicle speed is less than  $vStationarySpeedThresh$ . [6.3.6-V2V-BSMTX-DATAACC-048]

NOTE: An example PP algorithm is provided in Appendix A.6. Using constant radii provides sufficiently high confidence to support the target use cases because the PP is updated for every BSM transmission.

#### 6.3.6.18 DE\_ExteriorLights

- If the DF\_VehicleSafetyExtensions data frame includes DE\_ExteriorLights, the System shall set the individual light indications in the DE\_ExteriorLights according to the available vehicle status data. [6.3.6-V2V-BSMTX-DATAACC-049]

### 6.3.6.19 Additional Data Elements

- The System shall not include any additional data elements or data frames in transmitted BSMs beyond those required in this standard. [6.3.6-V2V-BSMTX-DATAACC-050]
- On reception, the System shall be capable of ignoring unused data frames/elements [6.3.6-V2V-BSMTX-DATAACC-051]

Note: This requirement is needed to ensure that vehicle safety communications are not subject to undesired channel congestion caused by excessive message size.

Note: Other standards within the SAE J2945 family of standards that apply to vehicle types other than Light Vehicles may have additional requirements that permit use of additional data frames and elements.

### 6.3.7 Data Persistency (DATAPERSIST)

#### 6.3.7.1 Heading

- The System shall store the last known heading value in persistent memory upon System device shutdown. [6.3.7-V2V-BSMTX-DATAPERSIST-001]

NOTE: This is to enable the heading to be retrieved upon System device startup.

- The System shall read the heading value from persistent memory upon System device startup. [6.3.7-V2V-BSMTX-DATAPERSIST-002]

NOTE: This is to enable the use of a last known heading upon System device startup.

NOTE: These data persistency requirements ensure robustness of the System upon device startup and address crash scenarios involving stationary and stopped vehicles.

#### 6.3.7.2 Path History

- The System shall store the last known PH in persistent memory upon device shutdown. [6.3.7-V2V-BSMTX-DATAPERSIST-003]

NOTE: This is to enable the PH to be retrieved upon System device startup.

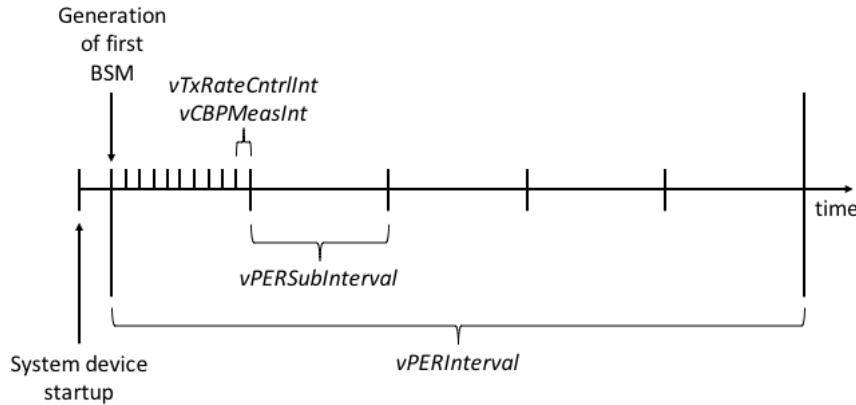

- The System shall read the PH from persistent memory upon System device startup. [6.3.7-V2V-BSMTX-DATAPERSIST-004]

NOTE: This is to enable the use of a last-known PH upon device startup.

### 6.3.8 BSM Scheduling and Congestion Control (BSMCONGCTRL)

This Section specifies the requirements for scheduling BSMs and congestion control, based on the research and development documented in 0, 0 and 0. Refer to Appendix A.8 for additional implementation details of the congestion control algorithm.

- The System shall generate BSMs using the congestion control algorithm defined in Sections 6.3.8.1 through 0. Those Sections use the following computational intervals:  $vCBPMeasInt$ ,  $vPERSubInterval$ ,  $vPERInterval$  and  $vTxRateCntrlInt$ . The relationship between those intervals is shown in Figure 22. [6.3.8-V2V-BSMTX-CONGCTRL-001]

**Figure 22 - Relationship between Computational Intervals:  $vCBPMeasInt$ ,  $vPERSubInterval$ ,  $vPERInterval$  and  $vTxRateCntrlInt$**

The calculations corresponding to a given computational interval are always performed at the end of that computational interval, and  $k$  denotes a given instance of that interval. The calculations use inputs collected during the given interval and are written as a function of  $k$ . For example, if  $F$  represents a specific function,  $F(k)$  is a computation using inputs collected during the  $k^{th}$  instance of the interval (also referred to as the  $k^{th}$  interval).

#### 6.3.8.1 Inputs

This Section defines the inputs that are used by the congestion control algorithm. Raw Channel Busy Percentage (RawCBP) and Smooth Channel Busy Percentage (CBP) are calculated at the end of the  $k^{th}$  instance of  $vCBPMeasInt$  as follows:

- RawCBP: RawCBP is the percentage of time the channel was busy during a given instance of  $vCBPMeasInt$ . The channel is busy when the DSRC Radio Subsystem is either transmitting or its Clear Channel Assessment function indicates the channel is busy, as defined in 802.11 [2]. RawCBP includes channel busy time due to both carrier sensing and energy detection, but it does not include virtual channel busy time based on the Network Allocation Vector [2]. RawCBP( $k$ ) is calculated as follows:

$$RawCBP(k) = \frac{(100 \times Duration\ Channel\ Indicated\ as\ Busy)}{vCBPMeasInt} \quad (\text{Eq. 1})$$

- Smooth CBP: The System calculates the Smooth CBP, CBP( $k$ ), based on RawCBP( $k$ ) and CBP( $k-1$ ), to reduce the impact of measurement noise, as follows:

$$CBP(k) = vCBPWeightFactor \times RawCBP(k) + (1 - vCBPWeightFactor) \times CBP(k - 1) \quad (\text{Eq. 2})$$

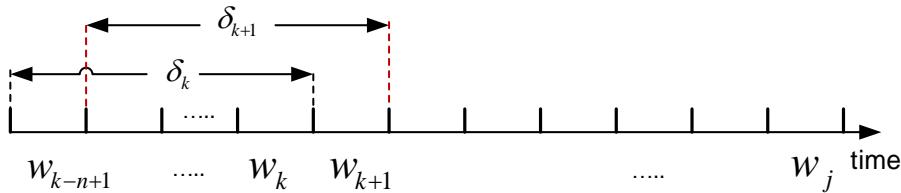

Packet Error Ratio (PER), Channel Quality Indicator ( $\Pi$ ), and Vehicle Density in Range (N) are calculated at the end of the  $k^{th}$  instance of  $vPERSubInterval$  as follows:

- PER: The PER is calculated between a pair of vehicles, the Host Vehicle (HV) and a given Remote Vehicle,  $RV_i$ . The System calculates the sliding-window PER over the interval,  $vPERInterval$ , at the end of the  $k^{th}$  instance of  $vPERSubInterval$  as follows:

Let  $\delta_k$  be the  $k^{th}$  instance of  $vPERInterval$ , and  $w_k$  be the  $k^{th}$  instance of  $vPERSubInterval$ . In Figure 23 the duration of  $\delta_k$  is  $n$  times the duration of  $w_k$ , where  $n$  denotes the number of subintervals within  $\delta_k$ . At the end of  $w_k$ , the number of missed BSMs and the total number of expected BSMs during the corresponding interval  $\delta_k$  are calculated for  $RV_i$ . The PER,  $PER_i(k)$ , for  $RV_i$ , during  $\delta_k$  is computed as follows:

$$PER_i(k) = \frac{\text{number of missed BSMs from } RV_i \text{ during } [w_{k-n+1}, w_k]}{\text{total expected BSMs from } RV_i \text{ during } [w_{k-n+1}, w_k]} \quad (\text{Eq. 3})$$

where  $k \geq n$ .

**Figure 23 - Sliding Window**

PER is calculated using the DE\_MsgCount data elements contained in the BSMs for each RV from which two or more BSMs were received during  $\delta_k$ . The number of expected BSMs for a given RV is 1 plus the difference between the values of DE\_MsgCount in the last and first BSMs received from that RV within  $\delta_k$ . The number of missed BSMs for the RV is the difference between the number of expected BSMs and the number of received BSMs from the RV within  $\delta_k$ . When calculating the number of expected and missed BSMs from a given RV, the modulus of the DE\_MsgCount data element is accounted for based on the range of DE\_MsgCount as defined in SAE J2735 [1].

If only one packet is received from a given RV during  $\delta_k$ , the PER corresponding to that RV is undefined and not used in PER calculations for  $\delta_k$ . Refer to Appendix 0 for examples of special PER calculation cases.

An RV is within  $vPERRange$  if the last BSM received from that RV during  $w_k$  contains a 2-D position within  $vPERRange$  of the HV's most recent 2-D Position Reference as of the time when PER is calculated. If a BSM is not received from that RV during  $w_k$  the RV is not within  $vPERRange$ .

- Channel Quality Indicator ( $\Pi$ ):  $\Pi(k)$  is calculated at the end of  $w_k$  as the average of  $PER(k)$  for all RVs within  $vPERRange$  and for which  $PER(k)$  is calculated, with the following constraint:

$$\begin{aligned} &\text{If } (\Pi(k) > vPERMax) \\ &\Pi(k) = vPERMax \end{aligned} \quad (\text{Eq. 4})$$

where  $PER(k)$  for a given RV,  $RV_i$ , is  $PER_i(k)$  from equation (3).

- Vehicle Density in Range (N): The HV (System) calculates  $N(k)$  at the end of  $w_k$  as the number of unique RVs within  $vPERRange$  (an RV is determined to be unique if it has a unique DE\_TemporaryID included in its BSM).

### 6.3.8.2 Calculate Tracking Error

This Section defines the steps used to calculate the tracking error used in the congestion control algorithm. Note that the tracking error is a result of the delay with which RVs receive the HV's kinematic state data due to transmission latencies and packet losses, and it is distinct from accuracy-related errors of the Positioning Subsystem.

The System performs the following operations in order at the end of the  $k^{th}$  instance of  $vTxRateCntrlInt$ :

- The System estimates the position of the HV at the current time, (the HV Local Estimate), per Appendix A.3, using the configuration parameters  $vHVLocalPosEstIntMin$  and  $vHVLocalPosEstIntMax$  in place of  $HVPosEstIntMin$  and  $HVPosEstIntMax$ , respectively. If per Appendix A.3  $\Delta_{time\_ms} > vHVLocalPosEstIntMax$ ,  $e(k) = 0$ , and the remaining steps in this Section (0) are not performed.
- Using the latest HV state information assumed received at RVs (see 0), the HV (System) calculates its position at the current time as it perceives the RVs have calculated its position (the HV Remote Estimate), per Appendix A.3. The HV Remote Estimate uses the configuration parameters  $vHVRemotePosEstIntMin$  and  $vHVRemotePosEstIntMax$  in place of  $HVPosEstIntMin$  and  $HVPosEstIntMax$ , respectively. If per Appendix A.3  $\Delta_{time\_ms} > vHVRemotePosEstIntMax$ ,  $e(k) = 0$ , and the remaining steps in this Section (0) are not performed.
- The System calculates the tracking error,  $e(k)$ , as the 2-D distance between the HV Local Estimate and the HV Remote Estimate.

NOTE: A reference implementation of the tracking error calculation is shown in Appendix A.8.2.

### 6.3.8.3 Calculate Transmission Probability

The System performs the following operations at the end of the  $k^{th}$  instance of  $vTxRateCntrlInt$ :

- The System calculates a transmission probability,  $p(k)$ , using the calculated tracking error as follows:

$$p(k) = \begin{cases} 1 - \exp(-\alpha \times |e(k) - T|^2) & \text{if } T \leq e(k) < S \\ 1 & \text{if } e(k) \geq S \\ 0 & \text{otherwise} \end{cases} \quad (\text{Eq. 5})$$

where  $T$  is the minimum communications-induced tracking error threshold,  $vTrackingErrMin$ ,  $\alpha$  is the error sensitivity  $vErrSensitivity$ , and  $S$  is the communications-induced tracking error saturation value  $vTrackingErrMax$ .

NOTE: The design rationale of equation (5) is that, when the tracking error is below the pre-defined threshold  $T$ , an HV does not broadcast a BSM due to tracking error. When the tracking error exceeds this threshold, the larger magnitude of tracking error would result in a higher transmission probability, unless the tracking error exceeds the threshold  $S$  in which case a BSM will always be sent due to tracking error. Since not all HVs have the same tracking error, they will use different levels of transmission probabilities to broadcast BSMs.

### 6.3.8.4 Calculate Maximum Inter-Transmit Time (Maximum BSM Generation Interval)

This Section defines the steps used to calculate the maximum BSM generation interval, Max\_ITT. The System performs the following operations at the end of the  $k^{th}$  instance of  $vTxRateCntrlInt$ :

- The System smooths the calculated current Vehicle Density in Range,  $N(k)$ , as follows:

$$N_s(k) = \lambda \times N(k) + (1 - \lambda) \times N_s(k - 1) \quad (\text{Eq. 6})$$

where  $\lambda$  is the weight factor  $vDensityWeightFactor$ , and  $N_s(k)$  is the smoothed current Vehicle Density in Range.

- The System calculates Max\_ITT( $k$ ) as follows:

$$Max\_ITT(k) = \begin{cases} 100 & N_s(k) \leq B \\ 100 \times \frac{N_s(k)}{B} & B < N_s(k) < \frac{vMax\_ITT}{100} \times B \\ vMax\_ITT & \frac{vMax\_ITT}{100} \times B \leq N_s(k) \end{cases} \quad (\text{Eq. 7})$$

where  $Max\_ITT(k)$  is the message generation interval in milliseconds,  $B$  is the density co-efficient  $vDensityCoefficient$ ,  $vMax\_ITT$  is the maximum threshold used in equation 7.

#### 6.3.8.5 Transmission Decision

This Section defines the steps for making the transmission decision.

The System performs the following operations at the end of the  $k^{th}$  instance of  $vTxRateCntrlInt$ , and when a Critical Event Condition initially occurs:

- The following logic is used to make the transmission decision (TxDecision\_Critical\_Event, TxDecision\_Dynamics, and TxDecision\_Max\_ITT are initialized to 0 prior to each Transmission Decision):

Transmission based on Critical Event Condition: If a Critical Event Condition is met (see 3.1), then

Set TxDecision\_Critical\_Event = 1

Transmission based on Vehicle Dynamics (i.e., based on Tracking Error in 0): Use the transmission probability from equation (5) and draw a uniform random number between 0 and 1 for a Bernoulli trial,  $rand()$ . If the outcome of the Bernoulli trial is true, and the time until the next scheduled BSM is greater than or equal to  $vRescheduleTh$ , i.e.,

If ( $rand() \leq p(k)$  && (NextScheduledMsgTime – CurrentTime)  $\geq vRescheduleTh$ ), then

Set TxDecision\_Dynamics = 1

Transmission based on change in Max\_ITT: Changes in the value of Max\_ITT affect the transmission decision as follows:

If (NextScheduledMsgTime - (LastTxTime + Max\_ITT( $k$ ))  $\geq vRescheduleTh$ ), then

Set TxDecision\_Max\_ITT = 1

where, NextScheduledMsgTime is the UTC in milliseconds at which the next BSM is scheduled for transmission, *CurrentTime* is the current UTC in milliseconds, LastTxTime is the UTC in milliseconds when the previous BSM was generated by the System, and  $vRescheduleTh$  is the threshold in milliseconds used in the transmission decision. The resolution of time is defined by  $vTimeAccuracy$ .

#### 6.3.8.6 Schedule Transmission

This Section defines the steps used to schedule BSM transmissions. The System performs the following operations immediately after the Transmission Decision (6.3.8.5):

- The System schedules BSM transmissions as and when required using the following logic:

If TxDecision\_Critical\_Event == 1 or TxDecision\_Dynamics == 1

- Cancel scheduled transmission
- Schedule transmission now, i.e., NextScheduledMsgTime = CurrentTime

Else if TxDecision\_Max\_ITT == 1

- Cancel scheduled transmission
- Schedule next transmission at NextScheduledMsgTime = max(CurrentTime,LastTxTime + Max\_ITT(k))

Else, BSM is generated as previously scheduled, i.e., if TxDecision\_Critical\_Event == 0 and TxDecision\_Dynamics == 0 and TxDecision\_Max\_ITT == 0

- No change to scheduled BSM transmission

#### 6.3.8.7 Calculate Radiated Power

This Section specifies the steps used to calculate the Radiated Power (RP) for the transmitted BSM. The corresponding transmit power setting may be derived from RP and calculated as follows (See 6.4.1):

- Transmit power = RP – MinSectorAntGain + CLoss

The System performs the following operations when CurrentTime = NextScheduledMsgTime.

If TxDecision\_Critical\_Event == 1 or TxDecision\_Dynamics == 1,

$$RP = vRPMax$$

Otherwise, the System calculates the Radiated Power as follows:

$$f(CBP) = \begin{cases} vRPMax & CBP \leq vMinChanUtil \\ vRPMax - \left( \frac{vRPMax - vRPMin}{vMaxChanUtil - vMinChanUtil} \right) \times (CBP - vMinChanUtil) & vMinChanUtil < CBP < vMaxChanUtil \\ vRPMin & vMaxChanUtil \leq CBP \end{cases}$$

(Eq. 8)

$$\text{Base\_RP} = \text{Previous\_RP} + vSUPRAGain \times (f(CBP) - \text{Previous\_RP}) \quad (\text{Eq. 9})$$

$$RP = \text{Base\_RP} \quad (\text{Eq. 10})$$

$$\text{Previous\_RP} = \text{Base\_RP} \quad (\text{Eq. 11})$$

where CBP is calculated at the end of the most recent instance of *vCBPMeasInt* (equation 2), *vRPMax* is the higher threshold for radiated power, *vRPMin* is the lower threshold for radiated power, *vMinChanUtil* is the lower threshold for channel utilization, *vMaxChanUtil* is the higher threshold for channel utilization, and *vSUPRAGain* is the Stateful Utilization-based Power Adaptation (SUPRA) gain. The initial value of RP (for the first BSM transmitted after system startup) is *vRP*.

If derived transmit power is higher than the System supports, the System uses the highest supported transmit power (*MaxTxPwrCap*). Transmit power granularity is defined by *vTxPwrCtrlStep* (see 0).

### 6.3.8.8 Generate BSM and Schedule Next BSM Generation

This Section defines the final steps in generating and transmitting the BSM.

The System performs the following operations in order when CurrentTime is NextScheduledMsgTime.

- The System generates the BSM for transmission at the transmit power necessary to achieve the calculated RP from Section 6.3.8.7.
- The System makes an assumption of the latest HV state information received by the RVs based on the Channel Quality Indicator per Appendix A.8.1.
- The System assigns LastTxTime = CurrentTime.
- The System schedules the next BSM to be generated at NextScheduledMsgTime = LastTxTime + Max\_ITT + RandOffset.
  - RandOffset and the value of Max\_ITT are defined as follows:
    - RandOffset is a pseudorandom number uniformly distributed between  $-vTxRand$  and  $+vTxRand$ .

NOTE: The randomization reduces repeated packet collisions of transmitted BSMs from multiple Systems.

- The value of Max\_ITT is calculated at the end of the most recent instance of  $vTxRateCntrlInt$  using equation 7.

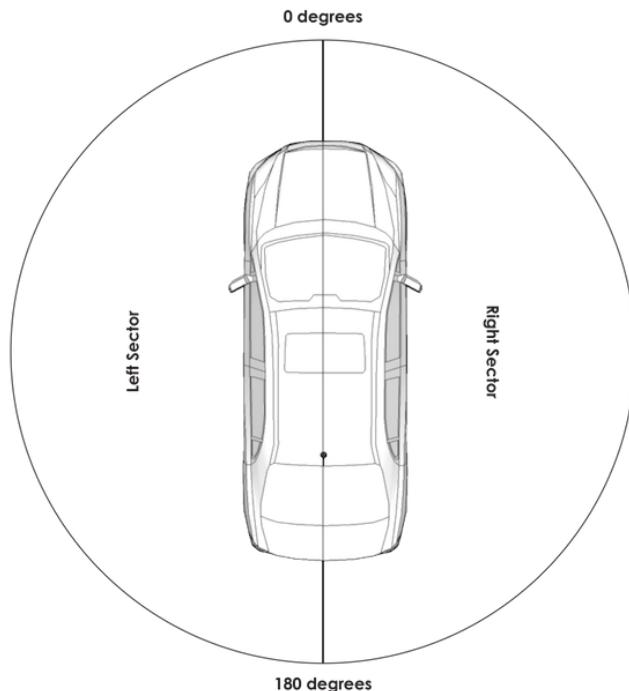

## 6.4 RF Performance Requirements (RFPERF)

### 6.4.1 DSRC Radiated Power and Transmit Power Accuracy (DSRCTX)

- The DSRC Radio Subsystem shall comply with the following:

$$\text{MinSectorAntGain} + \text{MaxTxPowerCap} - \text{CLoss} \geq vRP, \text{ where:}$$

- CLoss is the total cable and connector losses in dB.
- MinSectorAntGain is calculated in dBi as follows:
  - Divide the area around the vehicle into two sectors along the front to rear axis of the vehicle as shown in Figure 24.

**Figure 24 - RF Sectors for Antenna Gain Measurements**

- For azimuth angles from 0 to 180 degrees (the right sector), in a maximum of 2-degree azimuth increments, the vertically polarized antenna gain in dBi is measured from  $vMinEl$  to  $vMaxEl$  in 2-degree elevation increments with the antenna(s) mounted on or in a vehicle (i.e., in situ).
- For azimuth angles from 180 to 360 degrees (the left sector), in a maximum of 2-degree azimuth increments, the vertically polarized antenna gain in dBi is measured from  $vMinEl$  to  $vMaxEl$  in 2-degree elevation increments with the antenna(s) mounted on or in a vehicle (i.e., in situ).

NOTE: Both sectors include the measurements at 0 and 180 degrees.

- SectorAntGainAvg is calculated in dBi as the linear average of all of the measurements over one sector. It is calculated individually for the right and left sectors (see following note).

NOTE: The linear average over one sector is calculated by converting each measurement in dBi,  $G_i$ , to  $g_i = 10^{(G_i/20)}$ , then averaging  $g_i$  over all the measurements ( $g_{iave}$ ), and  $20 \times \log_{10}(g_{iave})$  is the result in dBi of the linear average.

- MinSectorAntGain is the lesser of the right and left sector SectorAntGainAvg values in dBi.
- MaxTxPowerCap is the maximum conducted transmit power setting in dBm of the DSRC Radio Subsystem at which 802.11 [2] transmitter requirements are met.

[6.4.1-V2V-RFPERF-DSRCTX-001]

NOTE: Compliance with vRP can be verified using a vehicle-level test, without separately measuring antenna gain and cable and connector losses. In implementation multiple (diversity) antennas can be used to meet the requirement. The methodology by which antenna diversity is implemented and tested is outside the scope of this standard.

#### 6.4.1.1 Transmit Power Accuracy

- The DSRC Radio Subsystem shall meet the 802.11 transmitter requirements for 10 MHz channel spacing with QPSK and  $\frac{1}{2}$  rate coding (e.g., frequency accuracy and relative constellation error specifications [2]) over the range of MaxTxPowerCap – PwrRange to MaxTxPowerCap. [6.4.1-V2V-RFPERF-DSRCTX-002]

- PwrRange is calculated in dB as follows:

$$\text{PwrRange} = \text{MinSectorAntGain} + \text{MaxTxPowerCap} - \text{CLoss} - vRPMax + vTxPwrRange$$

NOTE: The intent is to support the range of “radiated power” (6.3.8.7) from  $vRPMin$  to the minimum of the maximum supported radiated power and  $vRPMax$ .

- The transmit power out of the DSRC Radio Subsystem as measured at the antenna connector of the Subsystem housing shall be within  $vTxPwrAcc$  of its setting over 95% of test measurements at each setting within the range MaxTxPowerCap – PwrRange. [6.4.1-V2V-RFPERF-DSRCTX-003]
- The transmit power out of the DSRC Radio Subsystem measured at the antenna connector of the Subsystem housing shall be a monotonically increasing function of the transmit power setting in step sizes of  $vTxPwrCtrlStep$  over the range MaxTxPowerCap – PwrRange to MaxTxPowerCap. [6.4.1-V2V-RFPERF-DSRCTX-004]

NOTE: Finer power control steps than  $vTxPwrCtrlStep$  are permitted. These requirements support the congestion control requirements in 6.3.8.

#### 6.4.2 DSRC Receiver Sensitivity (DSRCRXSENS)

- The packet error rate of the DSRC Radio Subsystem shall be 10% or less when the PSDU length is 400 octets and the input level is  $vRxSens$  dBm at 6 Mbps (QPSK with  $\frac{1}{2}$  rate coding), at room temperature (21 degrees Celsius +/- 5 degrees). The minimum input levels are measured at the antenna connector of the System housing. [6.4.2-V2V-RFPERF-DSRCRXSENS-001]
- The DSRC Radio Subsystem shall comply with the standard (dot11ACRTyp = 1) adjacent and non-adjacent channel rejection requirements for 6 Mbps (QPSK with  $\frac{1}{2}$  rate coding), as specified in 802.11 [2], with the following measurement modifications:
  - The receiver sensitivity is  $vRxSens$ .
  - The PSDU length is 400 octets.

[6.4.2-V2V-RFPERF-DSRCRXSENS-002]

NOTE: Receiver tests can be done in a controlled environment (“bench test”), and the input to the System can be via a cable.

### 6.5 Security and Privacy Requirements (SECPRIV)

#### 6.5.1 Identification Randomization (IDRAND)

- The System shall randomize its DSRC Radio Subsystem Medium Access Control (MAC) address upon power-up. [6.5.1-V2V-SECPRIV-IDRAND-001]
- If the certificate used to sign the BSM has changed since transmitting the most recent BSM, the System shall re-randomize its DSRC Radio Subsystem MAC. [6.5.1-V2V-SECPRIV-IDRAND-002]

NOTE: DE\_MsgCount, DE\_TemporaryID and the DSRC Radio Subsystem MAC address are each randomly reinitialized when the security certificate changes. Refer to Sections 6.3.6.2 and 6.3.6.3 for randomization requirements for the BSM DE\_MsgCount and DE\_Temporary ID fields.

#### 6.5.2 BSM Signing (BSMSIGN)

- The System shall sign every BSM using the security credentials defined by 1609.2 [3], as profiled in 6.1.2. [6.5.2-V2V-SECPRIV-BSMSIGN-001]
- The System shall attach a certificate or certificate digest to every BSM as defined by 1609.2 [3]. [6.5.2-V2V-SECPRIV-BSMSIGN-002]
- The System shall attach a certificate to a BSM when the time interval between the current BSM and the generation of a previous BSM with an attached certificate (not certificate digest) is greater than or equal to  $vMaxCertDigestInterval$ . [6.5.2-V2V-SECPRIV-BSMSIGN-003]
- The System shall attach the entire certificate (not a certificate digest) to the BSM when a Critical Event Flag is set. [6.5.2-V2V-SECPRIV-BSMSIGN-004]
- The System shall not transmit BSMs when it has no valid certificates. [6.5.2-V2V-SECPRIV-BSMSIGN-005]
- The System shall not transmit BSMs with an expired certificate. [6.5.2-V2V-SECPRIV-BSMSIGN-006]
- The System shall attach the entire certificate (not a certificate digest) to the first BSM generated after System device startup. [6.5.2-V2V-SECPRIV-BSMSIGN-007]
- The System shall attach the entire certificate (not a certificate digest) to the first BSM generated after the certificate has been changed. [6.5.2-V2V-SECPRIV-BSMSIGN-008]

#### 6.5.3 Certificate Change (CERTCHG)

- To preserve privacy, the System shall not use the same certificate for more than  $vCertChangeInterval$  consecutive minutes, unless one or more of the following exceptions holds.
  - Exceptions:
    - The System is separated by less than  $vCertChangeDistance$  in absolute distance from the location at which the last certificate change occurred.
    - One or more Critical Event Flags are set.

[6.5.3-V2V-SECPRIV-CERTCHG-001]

- The System shall not change its certificate as long as one or more Critical Event Flags are set, unless the certificate expires. [6.5.3-V2V-SECPRIV-CERTCHG-002]
- The System shall not change its certificate if it is separated by less than  $vCertChangeDistance$  in absolute distance from the location at which the last certificate change occurred, unless the certificate expires, or unless shutdown and startup have occurred since the last certificate change.[6.5.3-V2V-SECPRIV-CERTCHG-003]

NOTE: DE\_MsgCount, DE\_Temporary ID and the DSRC Radio Subsystem MAC address are each randomly reinitialized when the security certificate changes.

#### 6.5.4 BSM Cryptographic Verification (BSMVERIFY)

- If a System chooses to verify a BSM, the System shall verify the BSM using the signature of the BSM and the attached certificate. If a certificate digest instead of a certificate is received with the BSM, the System verifies the BSM using the certificate corresponding to the digest if the certificate was received with an earlier BSM from the same transmitter. [6.5.4-V2V-SECPRIV-BSMVERIFY-001]

### 6.5.5 Certificate Revocation (CERTREV)

- The System shall not transmit any messages with a certificate that is included in a Certificate Revocation List (CRL) that has been received and verified by the System. [6.5.5-V2V-SECPRIV-CERTREV-001]

## 6.6 Security Management (SECMGMT)

The System interfaces to a Device Configuration Manager (DCM) function for bootstrap processing and to the SCMS to request and download pseudonym certificates. Refer to 0 and 0 for a description of the DCM and SCMS.

The DCM function is expected to be a proprietary capability developed by device manufacturers to support the functions described in Section 6.6.1. The System to DCM interface is expected to be trusted and proprietary.

The System to SCMS protocol will be described in an interface specification published by the SCMS entity. The System uses the interface specification protocol to communicate with the SCMS, or any other secure protocol supported by the SCMS. This standard describes the System functions based on the informative text in 6.6.1.

The interface between the System and the Device Configuration Manager (DCM) may be via a direct, wired, or wireless communication. The System can interface with the SCMS via DSRC, Cellular, or other wireless network. The connection types are outside of the scope of this specification.

For the purpose of the security management requirements in this standard, the System is assumed to have access to a DCM connection during the bootstrap process and to an SCMS connection for subsequent security management functions. The SCMS connection is not always available on a continuous basis (e.g., if the System is using DSRC and is outside the range of an RSE with connectivity to the SCMS).

The System needs to be capable of resolving IP addresses using a secure Domain Name System (DNS). The methodology for doing this is outside the scope of this specification.

### 6.6.1 Bootstrap: Initialization and Enrollment Processing (Informative)

The bootstrap process takes place in a secure environment. The exact implementation of the bootstrap process is proprietary and outside the scope of this standard.

#### 6.6.1.1 Initialization Processing

- The System interfaces to a DCM to acquire the Root Certificate Authority (CA) certificate.
- The System interfaces to a DCM to acquire the Uniform Resource Locator (URL) of the Registration Authority (RA), Pseudonym Certificate Authority (PCA) certificates, Intermediate Certificate Authority (ICA) certificates, Misbehavior Authority (MA) certificate, Certificate Revocation List Generator (CRLG) certificate, security policies, and the current global Certificate Revocation List (CRL).
- The System is expected to obtain the RA certificate from the DCM. If the System does not receive an RA certificate from the DCM, it requests the certificate from the RA.
- The System resolves the IP address of the RA using a secure Domain Name System (DNS).

#### 6.6.1.2 Enrollment Processing

- After a System completes initialization, it interfaces to a DCM to acquire an Enrollment certificate.
- The System generates an enrollment public/private key pair, and provides the public key to the DCM for use in generating the Enrollment certificate. Alternatively, an external-to-the-device and trusted entity may generate a public/private key pair and provide them to the System.

#### 6.6.2 Certificate Loading (CERTLOAD)

- The System securely generates encryption and signing key pairs.
- The System obtains pseudonym certificates from the SCMS over a secure interface.
- The System obtains new batches of pseudonym certificates when necessary and connectivity to the SCMS is available.

NOTE: The three bulleted items above are related to SCMS protocol and interface requirements, which will be defined by the SCMS entity.

- The System shall be capable of securely updating root CA certificates. [6.6.2-V2V-SECMGMT-CERTLOAD-001]

#### 6.6.3 Certificate Storage (CERTSTORE)

- The System shall have at least  $vCertNvMemSize$  of non-volatile memory for storage of pseudonym certificates. [6.6.3-V2V-SECMGMT-CERTSTORE-001]
- The System shall have at least  $vSecMemSize$  of secure memory available for data requiring secure storage. [6.6.3-V2V-SECMGMT-CERTSTORE-002]
- The System shall store the individual, pseudonym certificates, the RA address, RA, Intermediate CA, and PCA certificates, System configurations, and security policies in non-volatile memory. [6.6.3-V2V-SECMGMT-CERTSTORE-003]
- The system shall store the Root CA certificate, Enrollment certificate, and system private keys in secure, tamper evident, non-volatile memory. [6.6.3-V2V-SECMGMT-CERTSTORE-004]

NOTE: Tamper evidence requirements are defined by FIPS 140-2 0.

#### 6.6.4 Certificate Revocation List Loading (CRLLOAD)

- The System shall store the most up-to-date CRL information it has received in non-volatile memory, subject to the minimum storage requirements below. [6.6.4-V2V-SECMGMT-CRLLOAD-001]
- The System shall have at least  $vCrlStoreSize$  of non-volatile memory for storing the CRL. [6.6.4-V2V-SECMGMT-CRLLOAD-002]

NOTE: The minimum CRL storage requirement (see Section 7) enables the storage of 10,000 CRL entries of 40 bytes each.

### 6.6.5 Secure Hardware (SECHW)

- The System shall incorporate secure hardware that complies with FIPS 140-2 0 requirements as specified for security level 2:
  - Operator authentication
  - Physical security
  - Operating system requirements
  - Cryptographic key management
  - Design assurance

[0-V2V-SECMGMT-SECHW-001]

- The System shall perform all private key operations within the secure hardware. [0-V2V-SECMGMT-SECHW-002]

## 7. PARAMETER SETTINGS

This Section contains the values assigned to the parameters identified in Section 6 of this standard (Table 21).

**Table 21 - Parameter settings for this standard**

Section Reference(s)	Parameter	Value	Rationale(s)
6.1.1, 6.1.2.2.2, 6.1.3, 6.1.4, 6.3, 6.3.2, 6.3.4, 6.3.6.16	vChannelNumber	172	1
6.1.2.2.2	vP2pcd_maxResponseBackoff	.25 seconds	7
6.1.2.2.2	vP2pcd_responseActiveTimeout	.25 seconds	7
6.1.2.2.2	vP2pcd_requestActiveTimeout	.25 seconds	7
6.1.2.2.2	vP2pcd_observedRequestTimeout	.25 seconds	7
6.1.2.2.2	vP2pcd_currentlyUsedTriggerCertificateTime	1 minutes	7
6.1.2.2.2	vP2pcd_responseCountThreshold	3	7
6.2.1	vPosDetRate	10 Hertz	2, 3
6.2.4, 6.3.6.5	vTimeAccuracy	1 milliseconds	2, 3
6.3.2	vDataRate	6 Mbps	3, 4, 5
6.3.3	vBSMRateTolerance	10 ms	3
6.3.6.4	vMaxPosAge	150 milliseconds	3
6.3.6.5	vPosAccuracy	1.5 meters	2, 3
6.3.6.6	vElevAccuracy	3 meters	2, 3
6.3.6.8	vSpeedAccuracy	1 kph	2, 3
6.3.6.10	vHeadAccuracyA	2 degrees	2, 3
6.3.6.10	vHeadAccuracyB	3 degrees	2, 3
6.3.6.10	vHeadingSpeedThresh	45 kph	2, 3

***Table 21 - Parameter settings for this standard (continued)***

Section Reference(s)	Parameter	Value	Rationale(s)
6.3.6.10	vHeadLatchThresh	4 kph	2, 3
6.3.6.10	vHeadUnlatchThresh	5 kph	2, 3
6.3.6.11	vStWhAnAccuracy	5 degrees	2, 3
6.3.6.12	vAccelAccuracy	0.3 meters/second <sup>2</sup>	2, 3
6.3.6.12	vVertAccelAccuracy	1 meters/second <sup>2</sup>	2, 3
6.3.6.12	vYawRateAccuracy	0.5 degrees/second	2, 3
6.3.6.14	vSizeAccuracy	0.2 meters	2, 3

Rationales:

1. The setting is the RF channel designated for public safety applications involving safety of life and property according to FCC rules (see 0).
2. The setting is based on the need to provide accurate and timely safety alerts for the use cases described in Section 4 (see 0).
3. The setting was obtained by extensively testing commercially available equipment and automotive sensors in a wide variety of driving environments, and the numbers were proven to be reasonable based on the equipment and sensor capabilities, while also supporting the use cases described in Section 4 (see 0, 0 – 0).
4. The parameter setting improves RF performance (reduces packet collisions) and/or is based on extensive congestion control research (see 0, [18] – [20]).
5. The setting is based on the design range of DSRC in the V2V environment, which is 300 meters, and the necessary number of PH points needed to provide accurate and timely safety alerts (see 0).
6. The settings are derived from calculations based on the size of certificates and/or best engineering judgment (see 0, 0).
7. The setting is based on recommendations from IEEE 1609.

## 8. NOTES

### 8.1 Revision Indicator

A change bar (I) located in the left margin is for the convenience of the user in locating areas where technical revisions, not editorial changes, have been made to the previous issue of this document. An (R) symbol to the left of the document title indicates a complete revision of the document, including technical revisions. Change bars and (R) are not used in original publications, nor in documents that contain editorial changes only.

PREPARED BY THE SAE DSRC (DEDICATED SHORT RANGE COMMUNICATION) TECHNICAL COMMITTEE

## APPENDIX A

## A.1 IMPLEMENTATION CONFORMANCE STATEMENT (NORMATIVE)

A conformance table is provided in Table 22. The “Conformant?” column is intended to be filled out by an implementer or tester to indicate compliance with mandatory and optional features.

**Table 22 - Implementation conformance table**

Section (this standard)	Requirement (Req.) Category	Req. Number	Mandatory/ Optional/ (M/O)	Conform -ant? (Y/N)	Requirement or Section Title (this standard)

**A.2 COORDINATE TRANSFORMATION (NORMATIVE)****FUNCTION**

ConvertXYtoLatLon(...)

**INPUT**

RefLat = e.g., REF\_LATITUDE (rad)  
 RefLon = e.g., REF\_LONGITUDE (rad)  
 RefHeading = e.g., REF\_HEADING (rad)  
 Y = ACROSS\_DISTANCE (m w.r.t. REF LATLON)  
 X = AHEAD\_DISTANCE (m w.r.t. REF LATLON)

```

a = 6378137;                                # semi-major axis of earth
f = 0.003353;                                 # flattening
f1 = (f*(2-f))^.5;                           # eccentricity
f2 = a*(1-f1^2)/(1-f1^2*(sin(RefLat))^2)^(3/2); # radius of earth in meridian
f3 = a/(1-f1^2*(sin(RefLat))^2)^(1/2);        # radius of earth in prime vertical
  
```

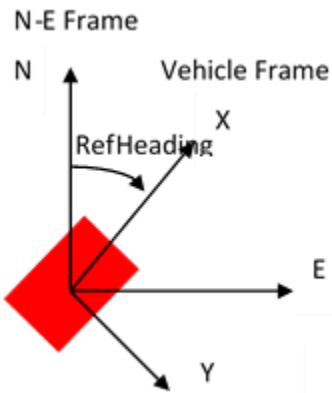

E = (cos(RefHeading)\*Y + sin(RefHeading)\*X;

N = (cos(RefHeading)\*X - sin(RefHeading)\*Y;

**OUTPUT**

NEW\_LATITUDE (rad) = (1/f2)\*N + RefLat;  
 NEW\_LONGITUDE (rad) = (1/(f3\*cos(RefLat)))\*E + RefLon;

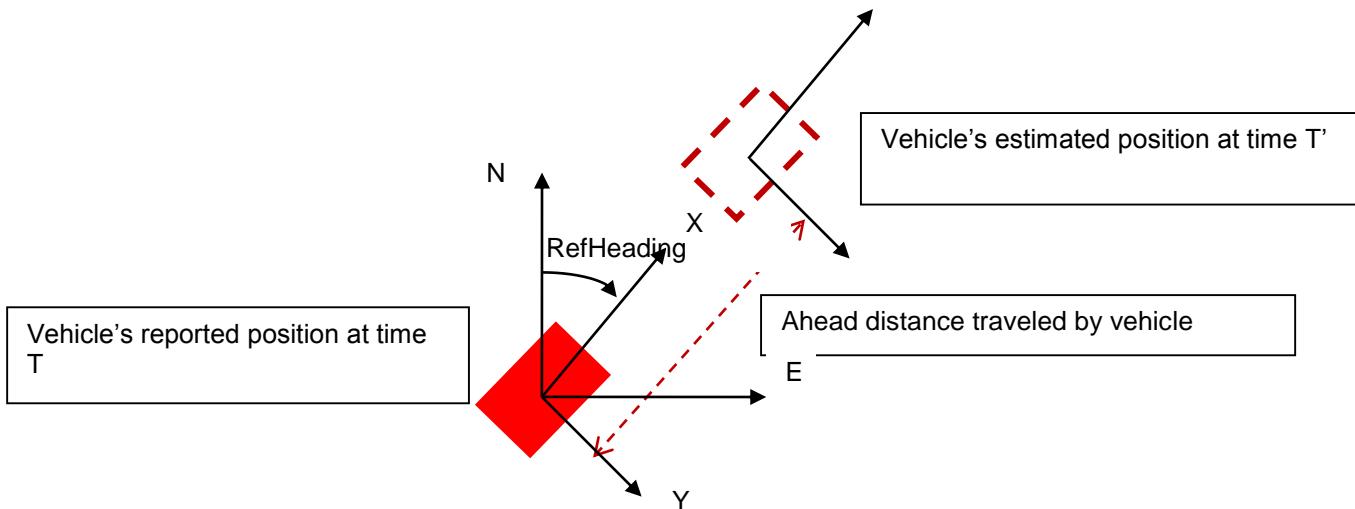

NOTE: The vehicle's local coordinate frame is represented in Figure 25.

**Figure 25 - Vehicle Coordinate Frame**

### A.3 2-D POSITION EXTRAPOLATION (NORMATIVE)

Position extrapolation for the HV Local Estimate and HV Remote Estimate is performed up to the current time based on the extrapolation details presented here. Position extrapolation estimates the vehicle's current position at time  $T'$  (current time), based on the vehicle's last known position, heading, and speed at time  $T$  (older time). The estimation assumes that the vehicle is moving at a constant speed and constant heading. It uses two variables to determine when to extrapolate, HVPosEstIntMin and HVPosEstIntMax. These values are variables based on the HV Local Estimate and HV Remote Estimate.

**Figure 26 - GNSS Position Extrapolation**

1. First find Delta\_time, the time since vehicle's last known position.

- $\text{Delta\_time\_ms} = T' - T$

2. Do not perform position extrapolation in the following cases:
  - If Delta\_time\_ms < HVPosEstIntMin, (New\_Latitude, New\_Longitude) is the last known position.
  - If Delta\_time\_ms > HVPosEstIntMax, then the vehicle has not received a position update for a very long time and its position is outdated.
3. If HVPosEstIntMin <= Delta\_time\_ms <= HVPosEstIntMax, then perform position extrapolation:
  - Calculate the estimated distance traveled by the vehicle in Delta\_time\_ms.
  - Ahead\_distance\_m = Speed\_mps \* Delta\_time\_ms / 1000
  - Across\_distance\_m = 0
4. Use ConvertXYtoLatLon function (provided in Appendix A.2) to find the vehicle's new position at time T'.
5. The extrapolated vehicle position at the current time is (New\_Latitude, New\_Longitude).

NOTE: For 3-D position extrapolation, the System may assume the elevation remains constant based on the last 3-D position update from the Positioning Subsystem.

#### A.4 CALCULATIONS INTO VEHICLE'S POSITION REFERENCE POINT

Consider Figure 21 where the BSM vehicle Position Reference point with respect to GNSS antenna location on the vehicle is represented as follows:

antOffsetX = Distance in meters to GNSS antenna location from vehicle Position Reference along the X axis (signed value)

antOffsetY = Distance in meters to GNSS antenna location from vehicle Position Reference along the Y axis (signed value)

antOffsetZ = Height in meters to the GNSS antenna from vehicle Position Reference along the Z-axis for an unloaded stationary vehicle on a planar surface. This value will always be negative. For example, for an antenna at the highest point on the roof, this value will be: - height of the antenna above ground (negative value) in meters. If the antenna is 1.05 m above the ground, then antOffsetZ = -1.05

Let

RefLat = e.g., GNSS Measured LATITUDE (rad)

RefLon = e.g., GNSS Measured LONGITUDE (rad)

RefHeading = e.g., GNSS Measured HEADING (rad)

Y = -antOffsetY

X = -antOffsetX

Use ConvertXYtoLatLon function (provided in Appendix A.2) to find the vehicle's 2-D position at Position Reference point.

For transmitting V2V safety messages, use the calculated New\_Latitude and New\_Longitude as vehicle's 2-D position at Position Reference point. These values are calculated for every V2V safety message transmitted.

Finally,

New\_Elevation = antOffsetZ + GNSS measured elevation (in meters).

## A.5 PATH HISTORY REFERENCE DESIGN (INFORMATIVE)

### A.5.1 Introduction

The Path History (PH) module for the V2V communications System uses a history of the past Global Navigation Satellite System (GNSS) locations traversed by the Host Vehicle (HV) and computes an adaptable, concise PH representation of recent vehicle movement over a certain distance. The PH communicated by a vehicle provides other vehicles with information needed for predicting the roadway geometry. It plays an important role in target vehicle classification, relative to the HV, with reference to the roadway. There are different methods for design and implementation of the PH module. Three different design methods are described here, each with a slightly different approach.

The PH module in the HV carries out these basic operations:

- Maintains a buffer of its recent GNSS positions and sensor data (updated at 100 ms) over a certain travel distance.
- Computes concise representation(s) of the actual PH of the vehicle based on allowable position error tolerance between the actual vehicle path and its concise path history representation.
- Updates the PH concise representation as an output periodically for use by other V2V Systems.

Besides having the capability to represent its PH adequately and use it internally, the HV transmits the concise representation of the path history data wirelessly over-the-air (OTA) to other vehicles in the vicinity. Other vehicles use this information for predicting the roadway geometry and for target vehicle classification.

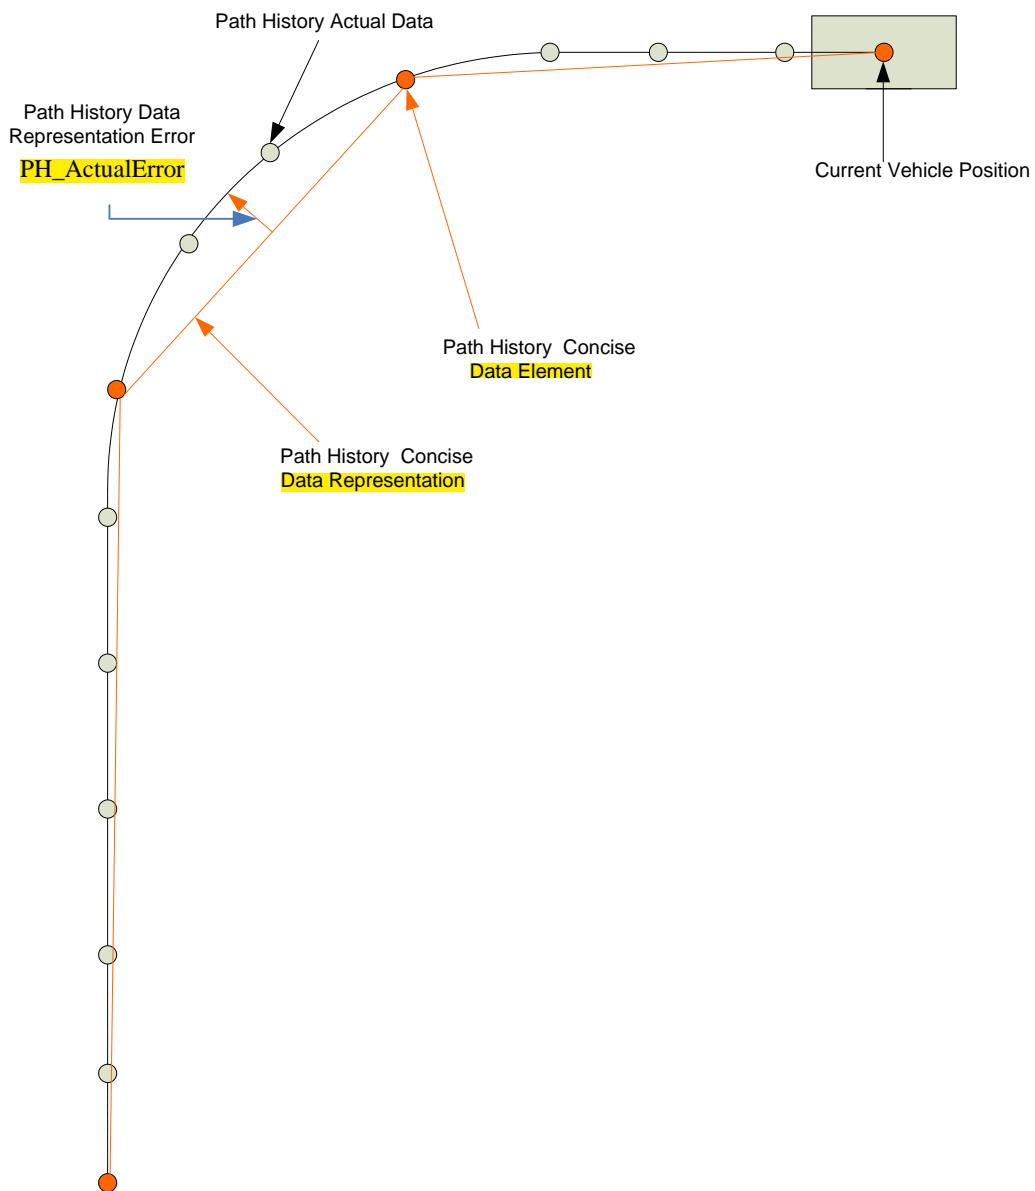

### A.5.2 Path History Requirements

The PH module requirements are as follows:

PH represents the HV actual path with a set of concise data elements. The concise data elements are a sampled subset of the actual data elements. As shown in Figure 27, the orange circles represent the sampled data concise points, and the chord connecting two consecutive concise data elements represents an approximation of the actual vehicle path segment.

The concise data elements are selected such that the perpendicular distance between any point on the actual vehicle path and the chord connecting two concise points (the concise representation of the actual vehicle path) is less than PH ActualError, as shown in Figure 27.

The size of the buffer containing the concise data elements is adaptable so that the represented PH distance computed using the elements of the buffer is at least a certain minimum length defined by the calibration parameter, K PHDISTANCE M (in meters). Referring to Figure 27, the total distance of all the chords connecting the orange concise data elements is a minimum distance of, K PHDISTANCE M meters.

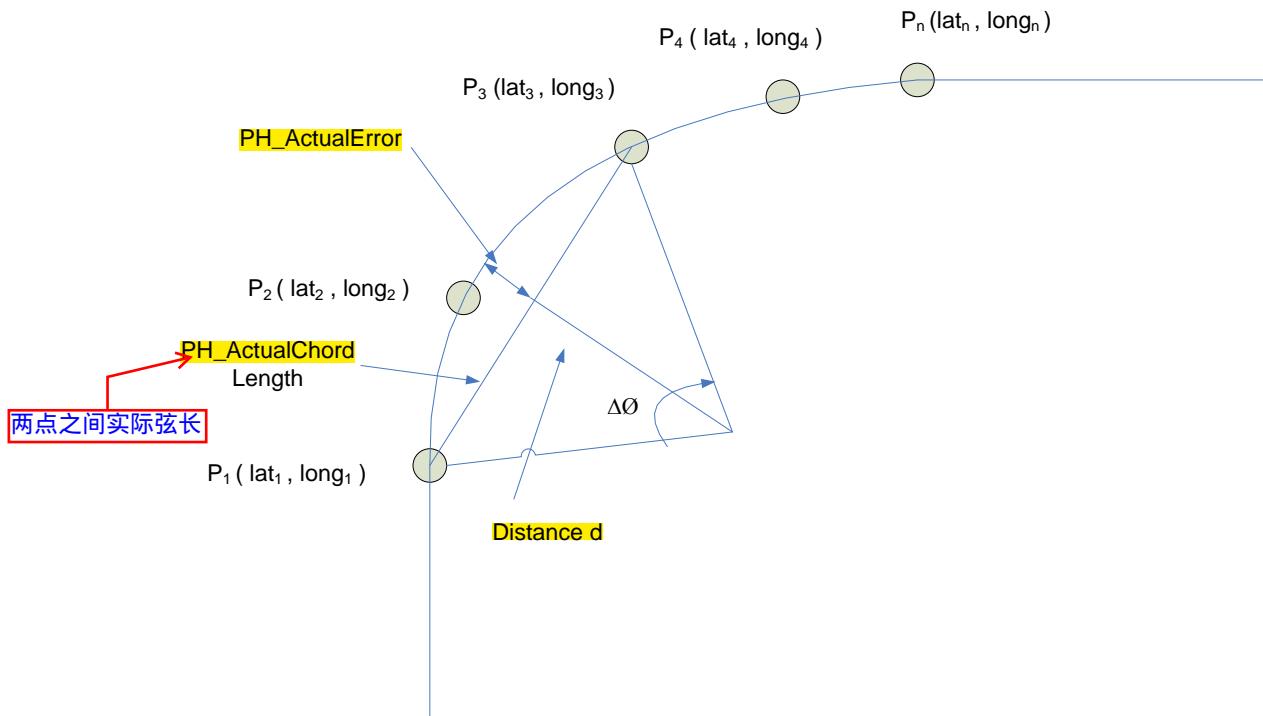

**Figure 27 - Concise and actual path history representation**

#### A.5.3 Path History Design

##### Design Preliminaries

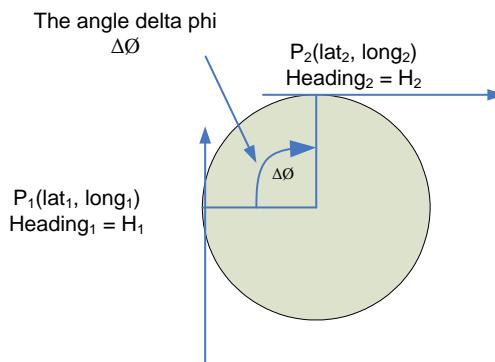

Three design methods for PH are presented below. This Section defines some basic design preliminaries used by PH design.

- a. It is assumed that the vehicle path is composed of straight and circular segments.
- b. PH\_ActualError is defined as the perpendicular distance between any point on the actual vehicle path and the chord connecting two concise points on the concise representation of the vehicle path. Some of the sampled points on the actual vehicle path may become part of the concise PH representation data elements according to the algorithm used. Please refer to Figure 28 for an illustration of PH\_ActualError and actual and concise PH data elements.
- c. Figure 28 illustrates points P<sub>1</sub>, P<sub>2</sub>, P<sub>3</sub>, etc. that lie on a circular vehicle path. As illustrated, PH\_ActualError varies based on the location of the points selected on the circular path.

**Figure 28 - Representation of Error**

- d. Consider Figure 29. The angle  $\Delta\phi$  subtended by points  $P_1$  and  $P_2$  at the center of the circle can be approximated as  $\Delta\phi = H_2 - H_1$ , where  $H_1$  and  $H_2$  represent the GNSS headings of the vehicle at locations  $P_1$  and  $P_2$  respectively on the circular path.

**Figure 29 - Representation of  $\Delta\phi$**

- e. Referring to Figure 28, we define the actual chord length between two PH GNSS points on the circular vehicle path as PH\_ActualChordLength. PH\_ActualChordLength is the distance between two GNSS data points each defined by its latitude and longitude
- f. Let  $P_1$  be defined by latitude,  $\text{lat}_1$ , and longitude,  $\text{long}_1$ . Similarly, let  $P_2$  be defined by latitude,  $\text{lat}_2$ , and its longitude,  $\text{long}_2$ . These values are in radians. Define the radius of the earth (in meters) at the meridian as REarthMeridian. Then the actual distance of the chord is given by:

$$\text{PH\_ActualChordLength} = \text{REarthMeridian} * \cos^{-1} [\cos(\text{lat}_1) \cos(\text{lat}_2) \cos(\text{long}_1 - \text{long}_2) + \sin(\text{lat}_1) \sin(\text{lat}_2)] \quad (1)$$

- g. Another critical parameter that is calculated during the design is PH\_EstimatedR, which is the radius of curvature of a circular vehicle path connecting two PH GNSS data points.

#### A.5.3.1 Design Method One

The steps involved in the design of the concise PH representation of a vehicle path using Method One are described as pseudo code next.

**Step One:** Assume that a number of actual vehicle path GNSS data points that follow the circular vehicle path are sampled. The minimum number of points required is three. Initial conditions of these points are (see Figure 28):

```
i = 3  
Starting Point, Pstarting = Pi-2  
Previous Point, Pprevious = Pi-1  
Next Point, Pnext = Pi  
elementPos = 0  
totalDist = 0  
incrementDist = 0
```

Include the GNSS point, P<sub>starting</sub>, as part of the concise PH representation data buffer and increment the elementPos by one as follows:

```
PH_ConciseDataBuffer[elementPos] = Pstarting  
elementPos++
```

**Step Two:** Calculate PH\_ActualChordLength (i.e., chord length in meters) between two points, the starting point, P<sub>starting</sub>, and the next point P<sub>next</sub>, as shown in Figure 28 and Equation 1. Now check if this value is greater than a certain threshold as follows:

```
If PH_ActualChordLength > K_PH_CHORDLENGTHTHRESHOLD,  
    Set PH_ActualError to K_PHALLOWABLEERROR_M + 1,  
    Go to Step Seven,  
Otherwise Continue.
```

**Step Three:** Calculate the angle  $\Delta\theta$  (in radians) subtended by points P<sub>starting</sub> and P<sub>next</sub> at the center of the circle as  $\Delta\theta = H_2 - H_1$ , where H<sub>1</sub> and H<sub>2</sub> represent the GNSS headings (in radians) of the vehicle at locations P<sub>starting</sub> and P<sub>next</sub> respectively (see Figure 28).

**Step Four:** Using PH\_ActualChordLength (Step Two) and  $\Delta\theta$  (Step Three), calculate the estimated radius of the curvature, PH\_EstimatedR (in meters), between two points P<sub>starting</sub> and P<sub>next</sub> as follows:

$$\text{PH\_EstimatedR} = \text{PH\_ActualChordLength}/(2*\sin(\Delta\theta/2)). \quad (2)$$

This is the estimated radius of curvature for a circular arc joining P<sub>starting</sub> and P<sub>next</sub>.

During this step a specific precaution needs to be taken. If  $\Delta\theta$  is very small or equal to zero (i.e., straight road path), then PH\_EstimatedR will be a very large number. To detect such a case,  $\Delta\theta$  is compared to a calibration parameter K\_PHSMALDELTAPEHI\_R. If  $\Delta\theta$  is less than this calibration parameter, then the radius is very large. In this case the radius is to be limited to a value of K\_PH\_MAXESTIMATEDRADIUS, and

```
If  $\Delta\theta < K_PHSMALDELTAPEHI_R$ ,
    Set PH_ActualError to zero,
    Set PH_EstimatedR to K_PH_MAXESTIMATEDRADIUS,
    Go to Step Eight,
Otherwise Continue.
```

**Step Five:** Calculate the distance d value (Equation 3), which is the perpendicular distance from the center of curvature to the actual chord connecting the sampled GNSS points  $P_{\text{starting}}$  and  $P_{\text{next}}$  on the vehicle PH. From Figure 28,

$$d = PH_{\text{EstimatedR}} * \cos(\Delta\theta/2). \quad (3)$$

**Step Six:** Calculate the actual maximum error PH\_ActualError as

$$PH_{\text{ActualError}} = PH_{\text{EstimatedR}} - d. \quad (4)$$

**Step Seven:** If PH\_ActualError is greater than the allowable PH error, K\_PHALLOWABLEERROR\_M, then add the previous point  $P_{\text{previous}}$  to the concise data buffer as follows:

```
If  $PH_{\text{ActualError}} > K_{\text{PHALLOWABLEERROR\_M}}$ 
    PH_ConciseDataBuffer[elementPos] =  $P_{\text{previous}}$ 
    elementPos++
```

Redefine three GNSS data points for further processing. The new points are set to the Starting Point, Previous Point, and Next Point as follows:

```
 $P_{\text{starting}} = P_{i-1}$ 
 $P_{\text{next}} = P_{i+1}$ 
 $P_{\text{previous}} = P_i$ 
 $i = i + 1$ 
Go to Step Nine.
```

Step Eight: If  $PH_{\text{ActualError}} \leq K_{\text{PHALLOWABLEERROR\_M}}$ , redefine the Previous Point and Next Point as:

```
 $P_{\text{next}} = P_{i+1}$ 
 $P_{\text{previous}} = P_i$ 
 $i = i + 1$ 
Go to Step Two.
```

The algorithm repeats itself with the assigned values of Starting Point, Previous Point, and Next Point. This procedure repeats until the error violation occurs.

**Step Nine:** Calculate the sum of the actual distances between the consecutive PH GNSS data points in the concise buffer PH\_ConciseDataBuffer as follows:

```
totalDist = totalDist + incrementDist
```

totalDist is the sum of distances between PH GNSS points in the concise data buffer PH\_ConciseDataBuffer.

incrementDist is the distance between the last two PH GNSS data points added to the concise data buffer. Hence, if the total distance is greater or equal to K\_PH\_DISTANCE\_M, then keep deleting elements from the bottom of the concise buffer (i.e., the oldest points) until the total distance becomes just enough to maintain a minimum value of K\_PH\_DISTANCE\_M. Output the radius of curvature between the recent two selected concise data points as PH\_EstimatedSumR. If the number of elements remaining in the concise buffer exceeds the maximum allowed (15), then keep deleting the oldest points in the buffer until only 15 points remain.

Go to Step Two.

#### A.5.3.2 Design Method Two

Method Two follows the same steps as Method One except for the calculation of the radius of curvature (PH\_EstimatedR defined in Equation 2 of Method One). For Method Two, the radius of curvature is an average of the calculation of the radius calculated in Method One and the radius calculated using vehicle speed and yaw rate. The steps involved in the design of the concise PH representation of a vehicle path using Method Two are described in pseudo code next:

**Step One:** Perform Method One, Step One.

**Step Two:** Perform Method One, Step Two.

**Step Three:** Perform Method One, Step Three.

Consider Figure 28 such that there exist n GNSS points, P<sub>1</sub>...P<sub>n</sub>. Consider P<sub>1</sub> as the Starting Point, and P<sub>n</sub> as the Next Point. Define P<sub>2</sub>, ..., P<sub>n-1</sub> as the Intermediate Points. Method Two calculates a running average (Step Four) of radii calculated by Equation 5 as follows:

$$\text{Radius} = v/w, \quad (5)$$

where, v is vehicle speed (meter/s) and w is the vehicle yaw rate (radian/s).

Given n points as in Figure 30, define R<sub>2i</sub> to be the radii calculated by Method Two at points i such that i = 1, ..., n-1. Hence, define the following radii as:

$$R_{21} = v_1/w_1$$

$$R_{22} = v_2/w_2$$

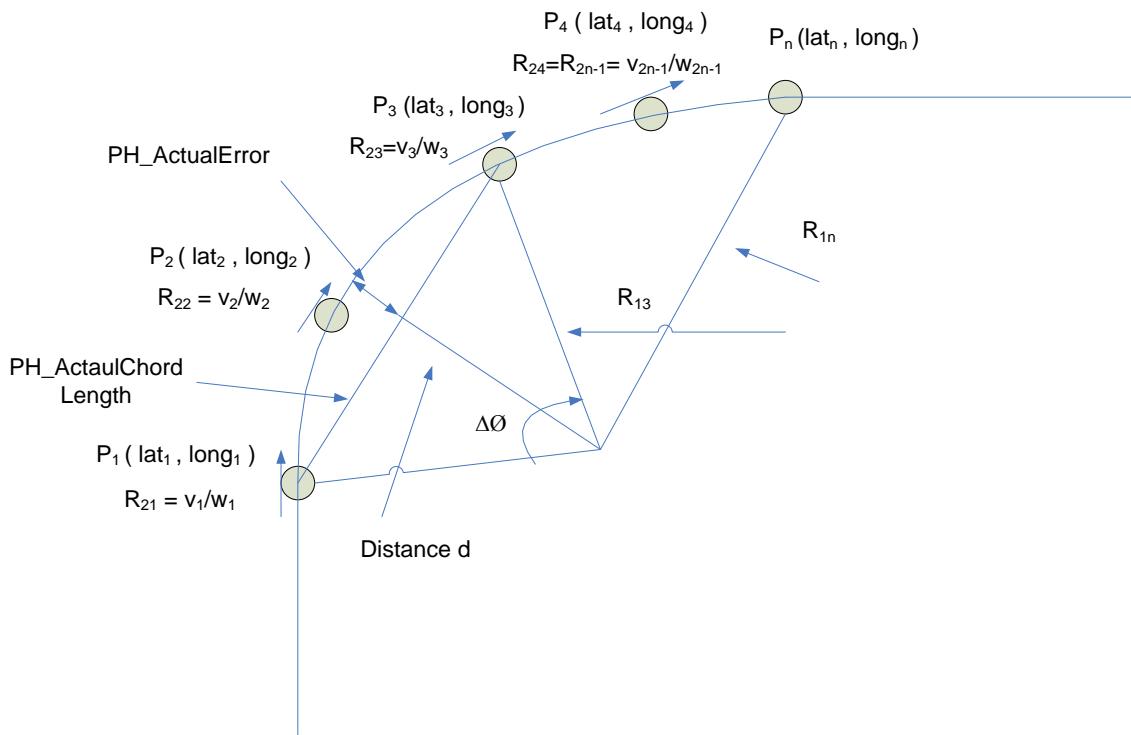

$$R_{23} = v_3/w_3$$

$$R_{2(n-1)} = v_{n-1}/w_{n-1}.$$

If the radius calculation is higher than a threshold value, set it to the maximum value K\_PH\_MAXESTIMATEDRADIUS and then ignore that radius, remove it from the radii buffer, and do not include it in the running average calculation in Step Four.

**Step Four:** Perform Method One, Step Four. We define the radius calculation from Equation 2 as PH\_EstimatedR<sub>1</sub>. The running average of radii, PH\_EstimatedR<sub>2</sub>, saved in the radii buffer computed in Step Three is given below as:

$$\text{PH_EstimatedR}_2 = \sum_{i=1}^{i=n-1} R_{2i} / n - 1 \quad (6)$$

**Figure 30 - Representation of estimated radius calculation**

The estimated radius of curvature, PH\_EstimatedR, is then calculated as a weighted sum between PH\_EstimatedR<sub>1</sub> and PH\_EstimatedR<sub>2</sub> as shown below:

$$\begin{aligned} \text{PH\_EstimatedR} &= \text{K\_PH\_RADIUSWEIGHTONE} * \text{PH\_EstimatedR}_1 \\ &\quad + \text{K\_PH\_RADIUSWEIGHTTWO} * \text{PH\_EstimatedR}_2, \end{aligned} \quad (7)$$

where, K\_PH\_RADIUSWEIGHTONE and K\_PH\_RADIUSWEIGHTTWO are weights that sum up to 1. If the running average radius PH\_EstimatedR<sub>2</sub> is zero as a result of all the radii in the buffer being set to the maximum value K\_PH\_MAXESTIMATEDRADIUS, then set K\_PH\_RADIUSWEIGHTONE = 1, and K\_PH\_RADIUSWEIGHTTWO = 0.

**Step Five:** Perform Method One, Step Five.

**Step Six:** Perform Method One, Step Six.

**Step Seven:** Perform Method One, Step Seven.

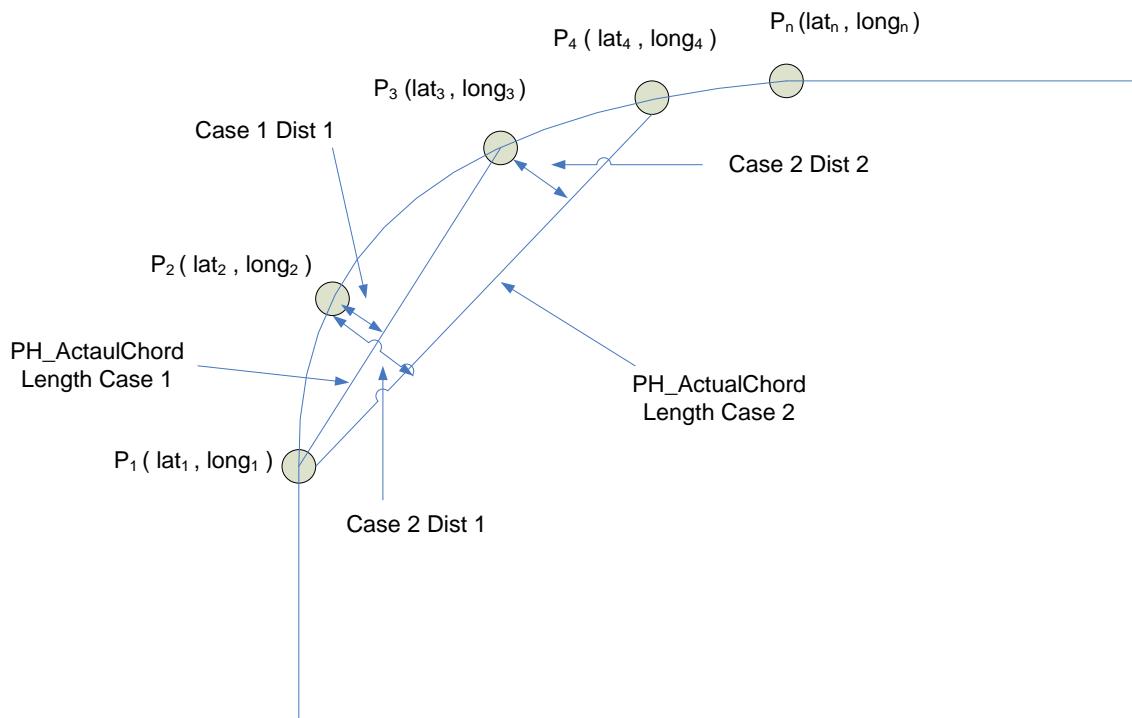

In addition, one has to adjust the running average PH\_EstimatedR<sub>2</sub> to the following. If radii at the new points,  $P_{\text{starting}}$  and  $P_{\text{next}}$ , are both equal to K\_PH\_MAXESTIMATEDRADIUS, then PH\_EstimatedR<sub>2</sub> would be the resulting running average of these points as calculated using Equation 6. Otherwise, if the radius at the new point,  $P_{\text{next}}$ , is not equal to K\_PH\_MAXESTIMATEDRADIUS, then PH\_EstimatedR<sub>2</sub> would be set to this radius value. Otherwise, if the radius at the new point,  $P_{\text{starting}}$ , is not equal to K\_PH\_MAXESTIMATEDRADIUS, then PH\_EstimatedR<sub>2</sub> would be set to this radius value. If none of the above is true, then PH\_EstimatedR<sub>2</sub> would be set to zero.

**Step Eight:** Perform Method One, Step Eight.

**Step Nine:** Perform Method One, Step Nine.

### A.5.3.3 Design Method Three

Method Three follows the same steps as Method One except for the calculation of the PH error. In this method, the definition of PH\_ActualError and the selection process of the concise PH data element are modified. PH\_ActualError is the maximum perpendicular distance between the actual vehicle PH data elements and the chord connecting the concise PH representation data elements.

**Figure 31 - Representation of PH Error for Method Three**

The steps involved in the design of the concise PH representation of a vehicle path using Method Three are described in pseudo code next.

**Step One:** Perform Method One, Step One.

**Step Two:** Calculate PH\_ActualChordLength (i.e., chord length in meters) between two points, the Starting Point,  $P_{\text{starting}}$ , and the Next Point  $P_{\text{next}}$ , as shown in Figure 28 and Equation 1.

```
If PH_ActualChordLength > K_PH_CHORDLENGTHTHRESHOLD,
Set PH_ActualError to K_PHALLOWABLEERROR_M + 1
Go to Step Six.
```

**Step Three:** Perform Method One, Step Three.

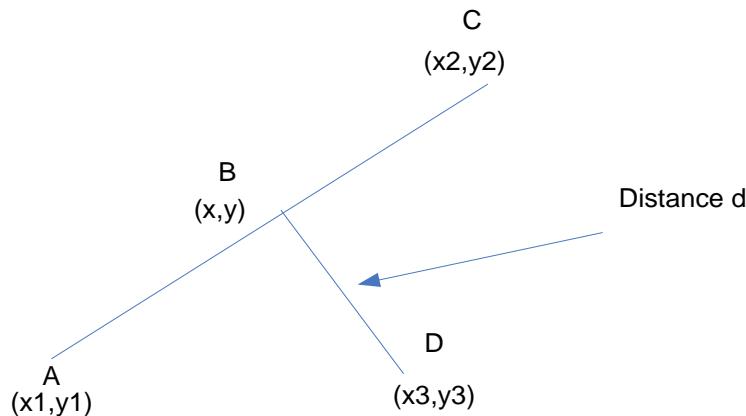

**Step Four:** Perform Method One, Step Four.

**Step Five:** Calculate PH\_ActualError as follows:

Define PH data elements, such that  $P_1$  is the Starting Point,  $P_n$  is the Next Point, and the Intermediate Points are  $P_2$  through  $P_{n-1}$  as shown in Figure 31. Define the perpendicular distance between the Intermediate Points and the chord connecting  $P_{\text{starting}}$  and  $P_{\text{next}}$  as  $D_i$ , where  $i = 2, \dots, n-1$ . Define PH\_ActualError as

$$\text{PH\_ActualError} = \text{MAX}(D_i); \quad i = 2, \dots, n-1. \quad (8)$$

The procedure of calculating the distances  $D_i$  is described next. Before performing the following calculations, the GNSS coordinates of the points must be represented into the North-East coordinate frame. The following provides a solution to finding the shortest distance from a point to a line or line segment.

**Figure 32 - Shortest distance from a point to a line segment**

Consider Figure 32. A solution is provided to the shortest distance from point **D** to the line segment AC. The equation of a line segment defined through two points **A** ( $x_1, y_1$ ) and **C** ( $x_2, y_2$ ) is given by

$$\mathbf{B} = \mathbf{A} + u(\mathbf{C} - \mathbf{A}),$$

where  $u$  is a value between 0 and 1. The point **B** ( $x, y$ ) on the line segment AC that is closest to **D**, satisfies

$$(\mathbf{D} - \mathbf{B}) \cdot (\mathbf{C} - \mathbf{A}) = 0,$$

where “dot” indicates the dot product of the vectors. Substituting for **B** in the above equation gives

$$[\mathbf{D} - \mathbf{A} - u(\mathbf{C} - \mathbf{A})] \cdot (\mathbf{C} - \mathbf{A}) = 0.$$

Solving this gives the value of  $u$  as

$$u = ((x_3 - x_1)(x_2 - x_1) + (y_3 - y_1)(y_2 - y_1)) / \| \mathbf{C} - \mathbf{A} \|^2.$$

Substituting this into the equation of the line gives the point of intersection **B** ( $x, y$ ) as

$$x = x_1 + u(x_2 - x_1),$$

$$y = y_1 + u(y_2 - y_1).$$

The distance therefore between the point **D** and the line is the Euclidean distance between (x,y) and **D**:

$$d = \sqrt{(x_3-x)^2 + (y_3-y)^2}.$$

NOTE: Before computing the distance of the point to a line segment, it is necessary to first test that u lies between 0 and 1.

**Step Six:** Perform Method One, Step Seven.

**Step Seven:** Perform Method One, Step Eight.

**Step Eight:** Perform Method One, Step Nine.

#### A.5.4 PH Module Signal Interface Description

In this subsection, the inputs, outputs, and calibration parameters used in the PH module are provided.

Inputs to the PH module are:

- Coordinated Universal Time (UTC) time
- Latitude
- Longitude
- Altitude (elevation)
- Speed
- Heading
- Yaw rate

Calibration parameters for the PH Module are:

- K\_PHDISTANCE\_M: 200 (meters)
- K\_PHDATAPOINTSSAMPLETIME\_S: 100 (ms)
- K\_PHALLOWABLEERROR\_M: 1 (meters)
- K\_PHSMALLDELTAPHI\_R: 0.02 (radians)
- K\_PH\_RADIUSWEIGHTONE: 0.5 (unitless)
- K\_PH\_RADIUSWEIGHTTWO: 0.5 (unitless)
- K\_PH\_CHORDLENGTHTHRESHOLD: 210 (meters)
- K\_PH\_MAXESTIMATEDRADIUS: 7FFFFF (meters)

The outputs are available in the concise PH data structure buffer and are the PH data elements. Outputs of the PH module are:

N; // number of PH concise representation data elements

PH\_CONCISE\_DATA\_ELEMENT\_1,

....

....

PH\_CONCISE\_DATA\_ELEMENT\_N,

where, PH\_CONCISE\_DATA\_ELEMENT consists of,

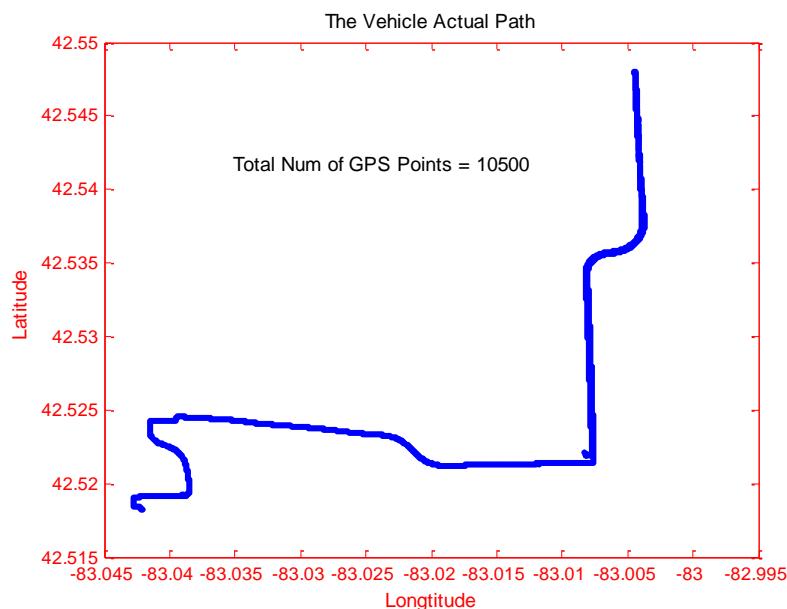

PH\_UTCTime; PH\_Latitude; PH\_Longitude; PH\_Altitude; PH\_Speed; PH\_Heading; PH\_YawRate;  
PH\_EstimatedSumR.

NOTE: If PH\_EstimatedSumR is greater than K PH\_MAXESTIMATEDRADIUS, then set PH\_EstimatedSumR to K PH\_MAXESTIMATEDRADIUS.

## A.5.5 Test Results

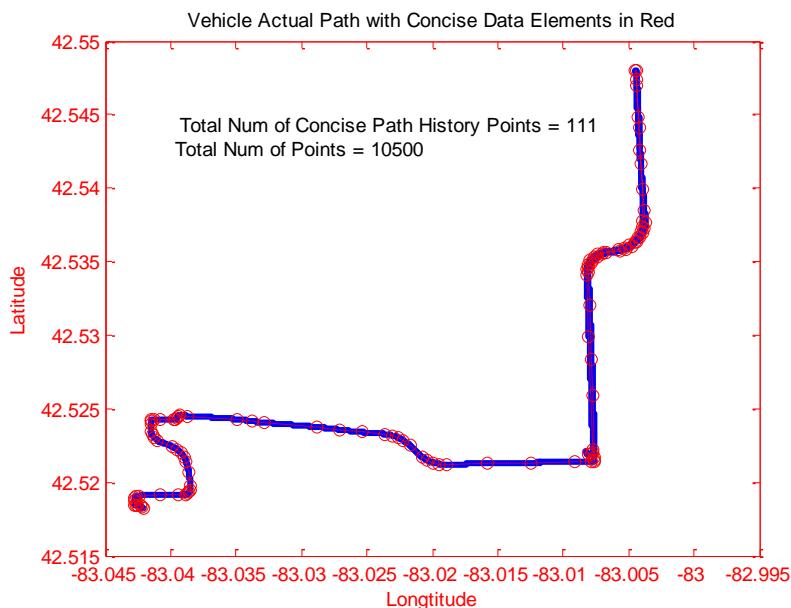

### A.5.5.1 PH Representation of Vehicle Path

Data were collected over a certain vehicle path as shown in Figure 33 below. GNSS data were collected using a NovAtel® OEMV® receiver with the data sampling interval of the actual vehicle position data being 100 ms. The actual vehicle path is represented by 10,500 GNSS data points. Note that these tests were done for a minimum PH distance of 300 meters, but the requirement was ultimately 200 meters.

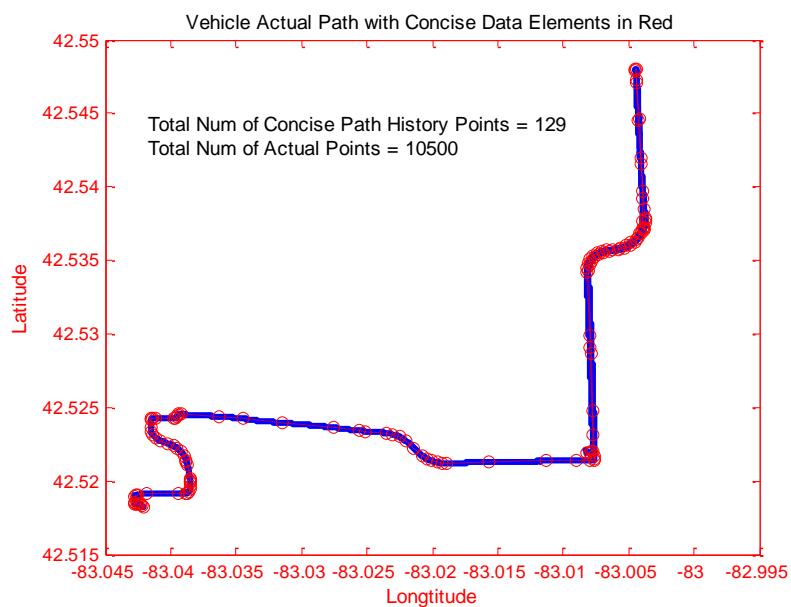

**Figure 33 - Vehicle actual path**

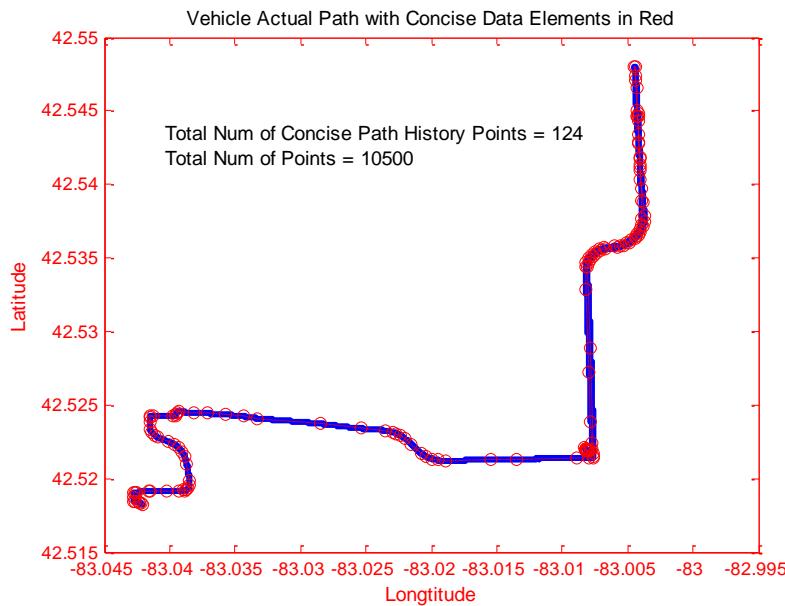

The test results evaluated the three PH methods and calculated the concise PH that approximates the actual vehicle path within an error tolerance of 1 m. Figure 34, Figure 35, and Figure 36 show in red circles the concise PH data elements representing the actual vehicle path. The actual vehicle path is shown in blue. Method One shows that the number of concise PH data elements needed to represent the vehicle path is 111. Method Two shows that the number of concise PH data elements needed to represent the vehicle path is 129. Method Three shows that the number of concise PH data elements needed to represent the vehicle path is 124.

**Figure 34 - Method one – representation of vehicle path**

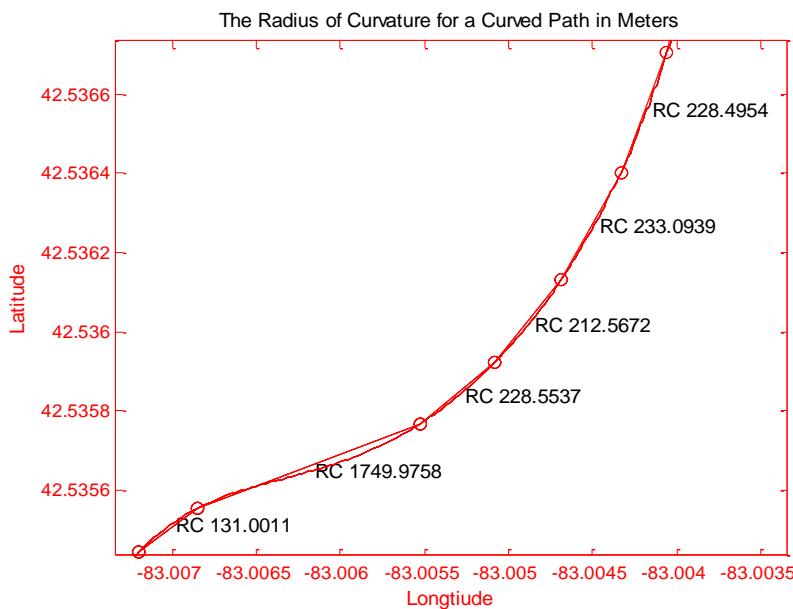

**Figure 35 - Method two – representation of vehicle path**

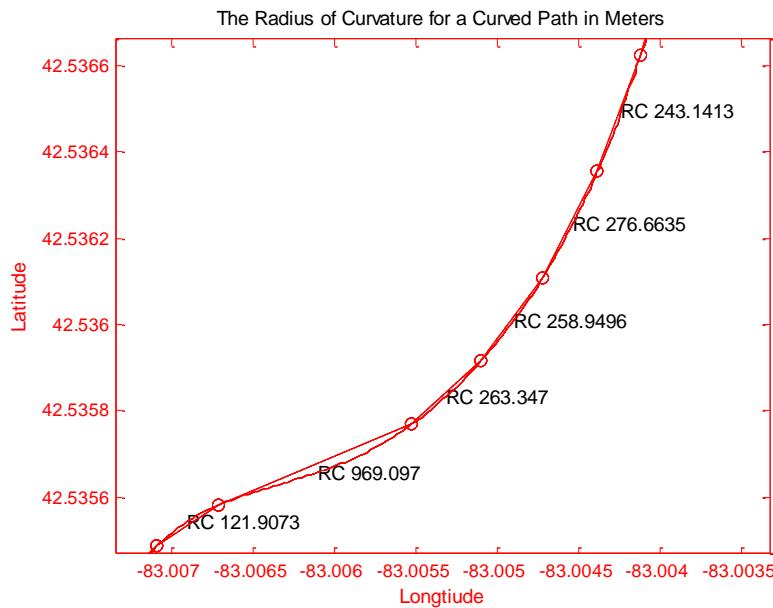

**Figure 36 - Method three – representation of vehicle path**

#### A.5.5.2 Radii of Curvature for a Curved Road

Figure 37 (Method One and Method Three) and Figure 38 (Method Two) show the radii of curvature (in meters) between successive, concise PH data points for a sharp, curved road segment of the vehicle path. **The radii of curvature clearly indicate the curved nature of the road segment. Notice that the road segment also includes a reasonably straight section represented with a larger radius of curvature.** In Figure 37 and Figure 38, the solid line indicates the actual vehicle path and the dotted lines indicate the concise PH representation.

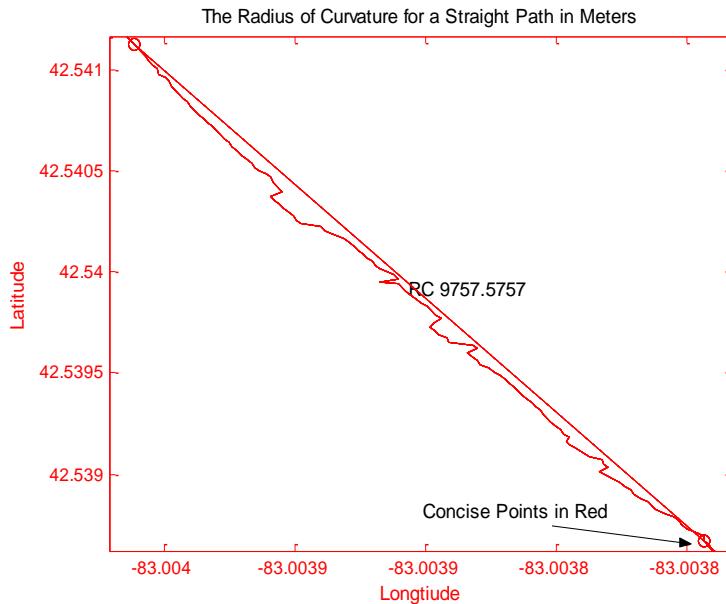

**Figure 37 - Methods one and three – radii of curvature for curved road**

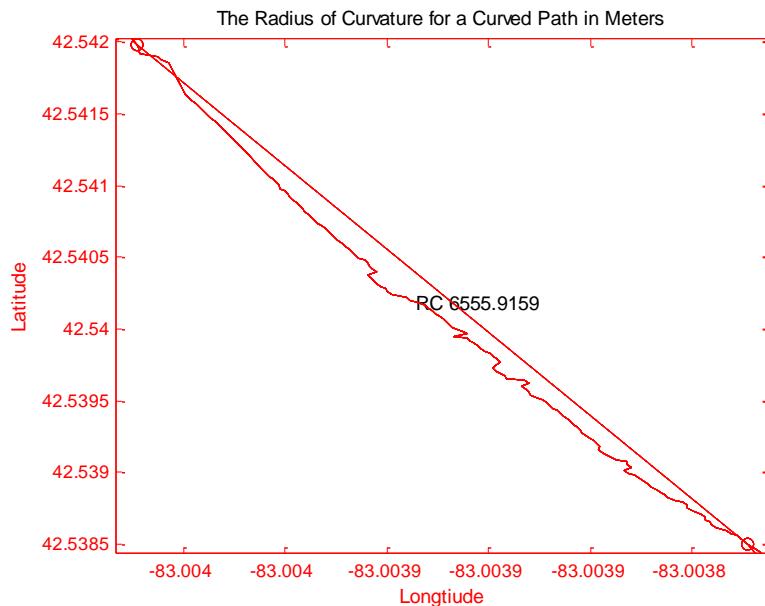

**Figure 38 - Method two – radii of curvature for curved road**

#### A.5.5.3 Radii of Curvature for a Straight Road

Figure 39 (Method One and Method Three) and Figure 40 (Method Two) show the radii of curvature (in meters) between successive concise data points for a straight road segment. The numbers indicate that the radius of curvature for a straight road segment is large. By examining these numbers, it is clear that the straight road segments are easily identified by using a certain threshold for radius of curvature. In Figure 39 and Figure 40, the solid line indicates the actual vehicle path and the dotted lines indicate the concise PH representation.

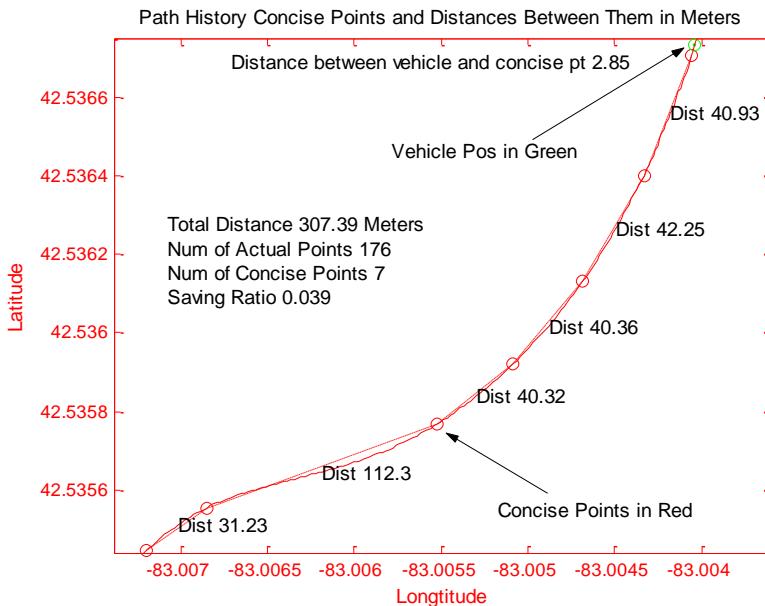

**Figure 39 - Methods one and three – radii of curvature for straight road**

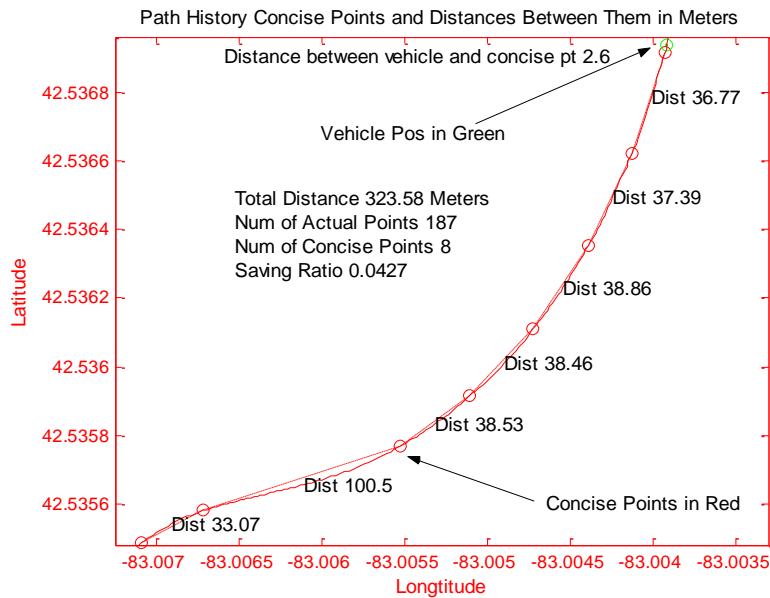

**Figure 40 - Method two – radii of curvature for straight road**

#### A.5.5.4 PH Concise Points and Distances Between Them for a Curved Road

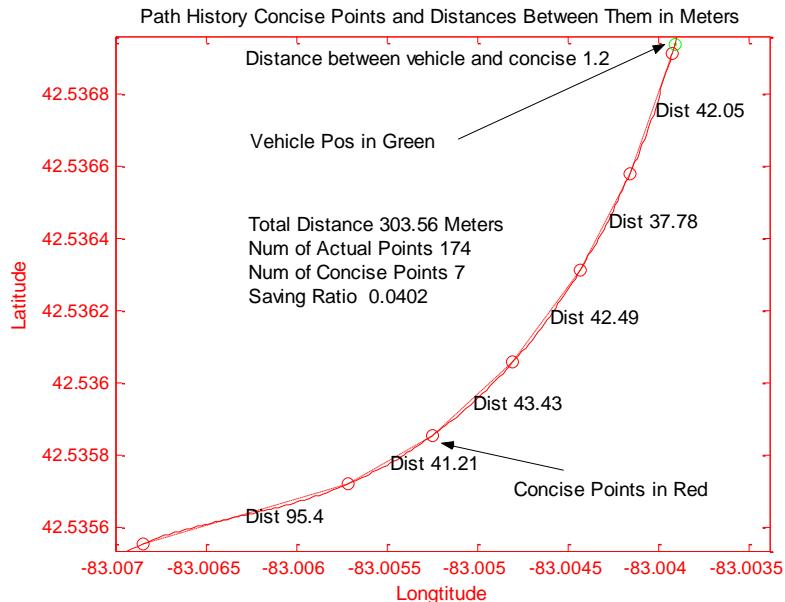

Figure 41 (Method One), Figure 42 (Method Two), and Figure 43 (Method Three) show the result for a curved road segment after concise data points have been computed to maintain the PH distance of at least 300 m from the current vehicle position (shown in green). No additional PH points can be dropped without violating the requirement of a minimum 300-meter PH distance. It is clear all methods require only a few PH points to represent a vehicle PH over a curved roadway segment as shown.

**Figure 41 - Method one – ph representation of curved road**

**Figure 42 - Method two – ph representation of curved road**

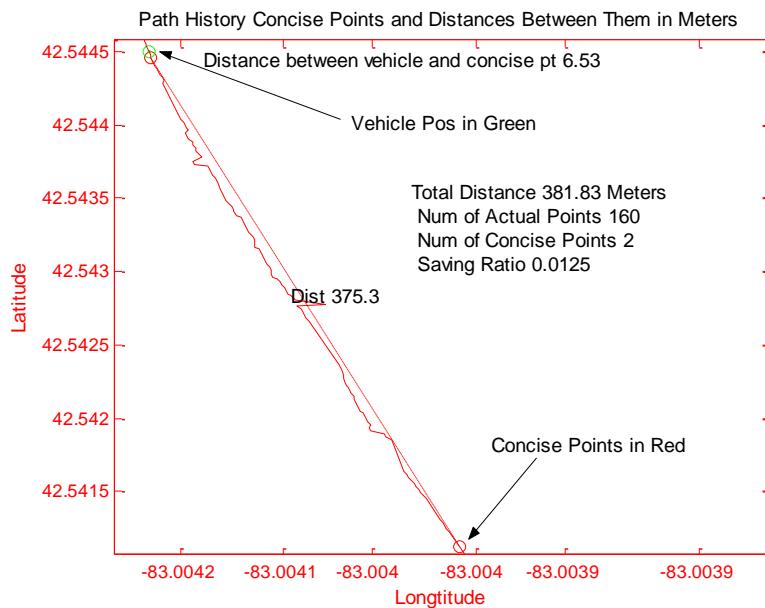

**Figure 43 - Method three – ph representation of curved road**

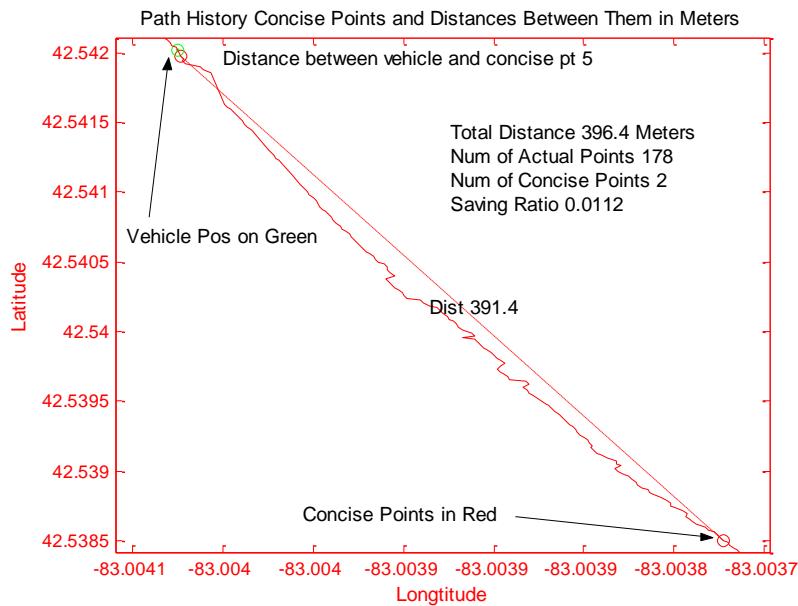

The saving ratio shown in Figure 41 through Figure 43 indicates the ratio of concise data elements to the actual data elements. The ratio indicates the saving in the representation of the actual path when using a concise PH representation for each of the proposed methods. In Figure 41 through Figure 43, the solid line indicates the actual vehicle path and the dotted lines indicate the concise PH representation.

#### A.5.5.5 PH Concise Points and Distances Between Them for a Straight Road

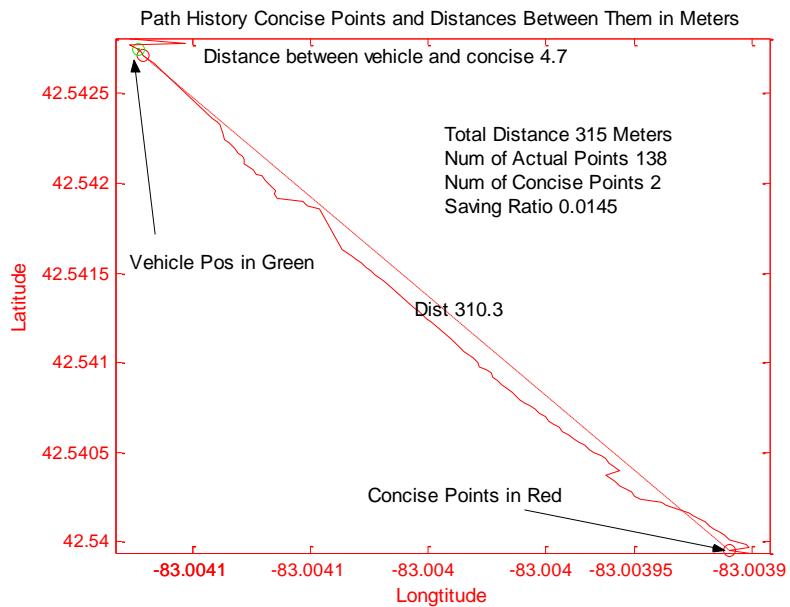

Figure 44 (Method One), Figure 45 (Method Two), and Figure 46 (Method Three) show the result for a straight road segment after concise data points have been computed to maintain the PH distance of at least 300 m from the current vehicle position (shown in green). No additional PH points can be dropped without violating the requirement of a minimum PH distance. From Figure 44, the algorithm of Method One selects two successive PH concise points for this road segment with a distance between them equal to 375.3 m. Similarly, from Figure 45, the algorithm of Method Two selects two successive PH concise points for this road segment with a distance between them equal to 391.4 m. Subsequent to collection of these test results, Step 2 of all the algorithms was modified so that the maximum distance between two successive PH concise points never exceeds the stated threshold distance of K\_PH\_CHORDLENGTHTHRESHOLD. Also notice from Figure 44 and Figure 45 that the total distance of the path history representation is 381.83 m and 396.4 m, respectively. The increase in path history representation distance is obtained without the need for any additional PH points over the minimum number of PH points needed to represent the path history for a minimum distance defined by the calibration parameter K\_PHDISTANCE\_M.

**Figure 44 - Method one – ph representation of straight road**

**Figure 45 - Method two – ph representation of straight road**

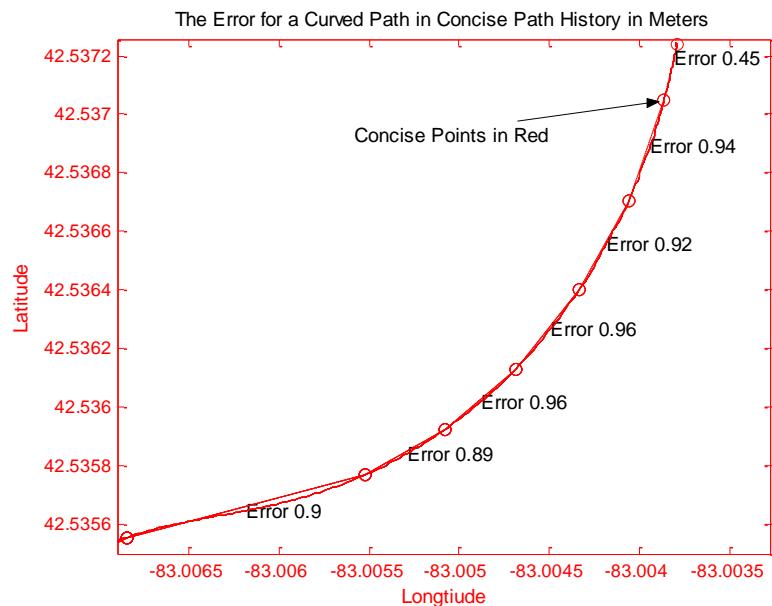

**Figure 46 - Method three – ph representation of straight road**

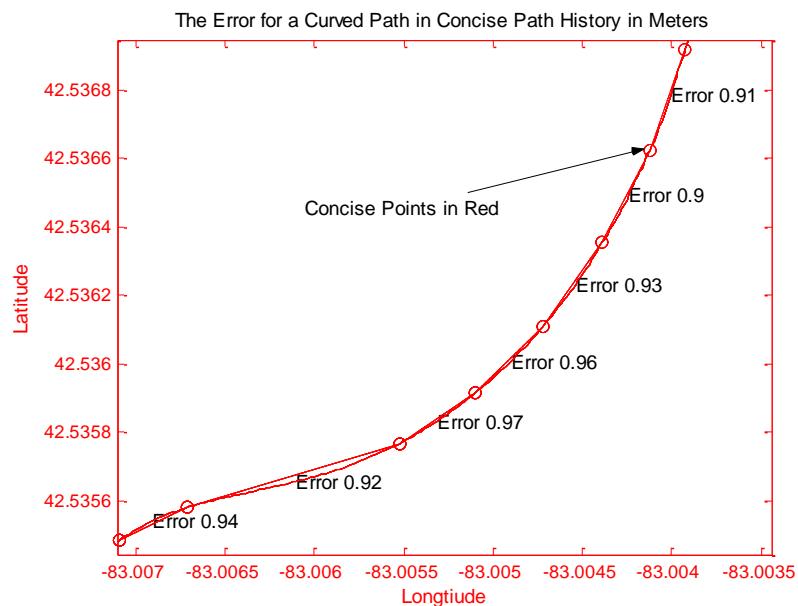

The saving ratio shown in Figure 44 through Figure 46 indicates the ratio of concise data elements to the actual data elements. The ratio indicates the saving in the representation of the actual path when using a concise PH representation for each of the proposed methods. In Figure 44 through Figure 46, the solid line indicates the actual vehicle path and the dotted lines indicate the concise PH representation.

#### A.5.5.6 PH Requirement Analysis

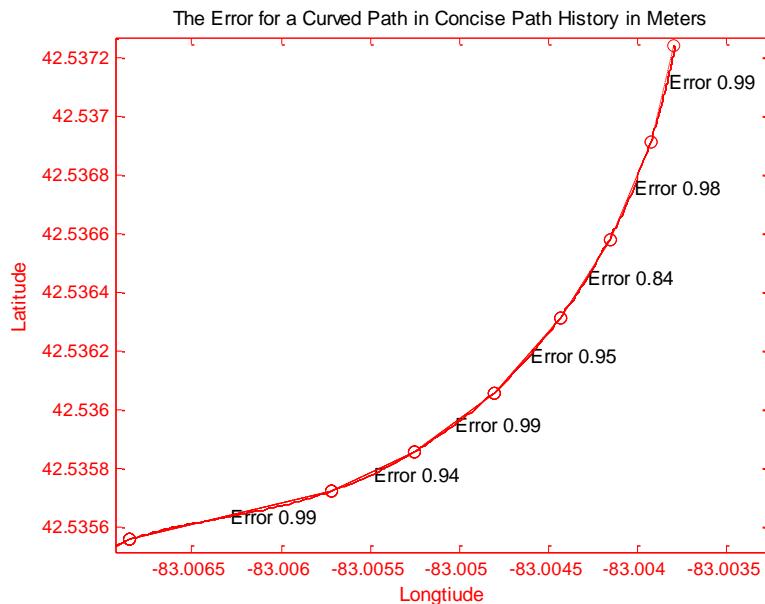

Figure 47 (Method One), Figure 48 (Method Two), and Figure 49 (Method Three) show the actual error between concise PH data elements. Since the concise data points are chosen based on the fact that they do not violate the actual error criterion of 1 m, it is clearly shown and verified in these figures that the actual error is always less than 1 m. Similar results are generated for a straight path. The significance of these results is that the concise PH data points can be used reliably to represent the actual vehicle PH. In Figure 47 through Figure 49, the solid line indicates the actual vehicle path and the dotted lines indicate the concise PH representation.

**Figure 47 - Method one – ph error analysis**

**Figure 48 - Method two – ph error analysis**

**Figure 49 - Method three – ph error analysis**

#### A.5.6 Summary

This standard has presented the PH module for a vehicle safety communications System. The module uses a history of the past GNSS locations traversed by the HV and computes an adaptable concise PH representation of recent vehicle movement over a certain distance. The PH communicated by a vehicle provides other vehicles with important information needed for predicting the roadway geometry. It plays an important role in target vehicle classification in vehicle safety communications. Three different methods for design and implementation of the PH module have been presented. These methods have also been implemented and their performance has been evaluated. Extensive testing has shown that the concise representations of the vehicle PH computed by the various methods offer significant savings in OTA wireless bandwidth when transmitting the PH information to other vehicles wirelessly, while guaranteeing that the PH error remains within the allowable tolerance of 1 m. Method One was chosen as the primary method used subsequently for VSC-A objective testing. The objective testing of VSC-A applications have also shown that the PH error tolerance of 1 m that was chosen as default satisfies the needed accuracy and meets the performance requirements of target classification and the safety applications that were developed and demonstrated in the VSC-A Project.

### A.6 PATH PREDICTION REFERENCE DESIGN (INFORMATIVE)

#### A.6.1 Introduction

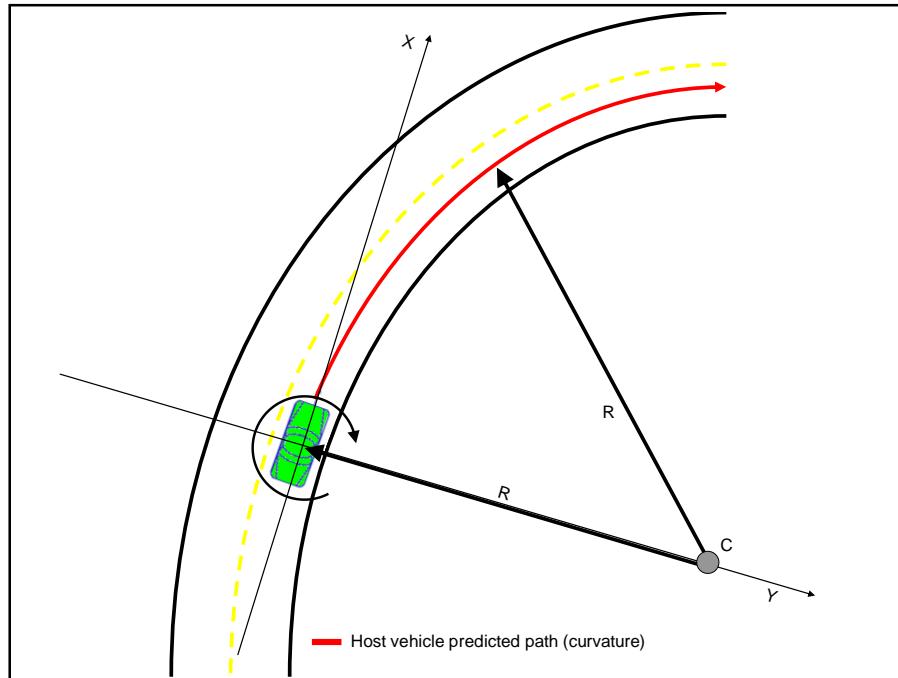

Path Prediction (PP) for the V2V safety communications System utilizes dynamics information provided by the vehicle to estimate the driver's intended future path. The estimate is provided without dependence on future road geometry information obtained from outside sources (e.g., map databases, vehicle probes).

PP carries out the following basic operations:

- Gathers vehicle dynamics information.
- Computes path radius using dynamics information to represent the driver's intended future path:
- Radius = 1/curvature ( $\rho$ ).
- Computes confidence of the predicted path based upon the rate of change of the vehicle dynamics to infer transient conditions (i.e., non-steady-state conditions).

### A.6.2 PP Design Approach

The primary PP design approach for the V2V safety communications System uses vehicle dynamics information to calculate a (continuous) radius of curvature representing the vehicle's estimated future path. This is accomplished by using simple physics equations to compute curvature based on the vehicle speed and the rate of change of heading (yaw rate). This curvature can be extrapolated forward to provide an estimate of the likely future path of the vehicle (Figure 50).

**Figure 50 - Vehicle projected path**

The PP module requires the following input signals:

- Vehicle Speed (meters per second [m/s] used in this example)
- Yaw Rate (degrees per second [degrees/s] used in this example)

Developers should pay careful attention to divide-by-zero conditions and appropriately cap intermediate and output calculations to prevent data type overflow. This is particularly important as vehicle speed approaches zero (see Simulink diagrams in subsequent Sections).

### A.6.3 Radius Calculation

In order to effectively filter a PP radius in meters, a reciprocal is computed in order to perform the filter operations on curvature ( $1/r$ ). This prevents large discontinuities in the filter input signal when the radius oscillates between positive and negative values approaching infinity. Once the curvature has been computed, the signal is filtered in order to attenuate unwanted high-frequency noise. The filter is designed and calibrated to greatly reduce the following effects:

- Road noise
- Sensor noise
- Driver noise (in-lane wandering)

For the PP module, a second order low-pass filter is used to remove these unwanted components from the yaw rate signal. The design is a discretized version of a standard second order unity-gain filter characterized by the following equations.

Discretized (unity-gain) second order low-pass filter:  
(Filtered Curvature)

$$\frac{\omega_0^2}{s^2 + 2\omega_0\zeta s + \omega_0^2} = \frac{\omega_0^2 T_s^2}{z^{-2} - (2+2\omega_0\zeta T_s)z^{-1} + (\omega_0^2 T_s^2 + 2\omega_0\zeta T_s + 1)}$$

Continuous (1/s = integrator)                          Discrete (1/z = unit delay)

$$y_n = \frac{-y_{n-2} + (2+2\omega_0\zeta T_s)y_{n-1} + \omega_0^2 T_s^2 u_n}{(1 + 2\omega_0\zeta T_s + \omega_0^2 T_s^2)}$$

(for n ≥ 3)

Initialization:  $y_1 = u_1$ ,  $y_2 = u_2$

**Figure 51 - Discretized second order low-pass filter**

In Figure 51,  $\omega_0 = 2\pi f_0$ ,  $f_0$  = cutoff frequency,  $\zeta$  = damping factor, and  $T_s$  = sampling time. Note:  $\zeta = 1$  (default) for a critically damped system.

The vehicle radius calculation follows the basic formula:

- radius (m) = vehicle speed (m/s) / yaw rate (radians/s)

In preparation of the radius calculation, the yaw rate is converted from degrees/s to radians/s. To prevent division by zero when the vehicle is stationary and to eliminate large discontinuities in the filter input signal, the reciprocal of radius is calculated to provide curvature input.

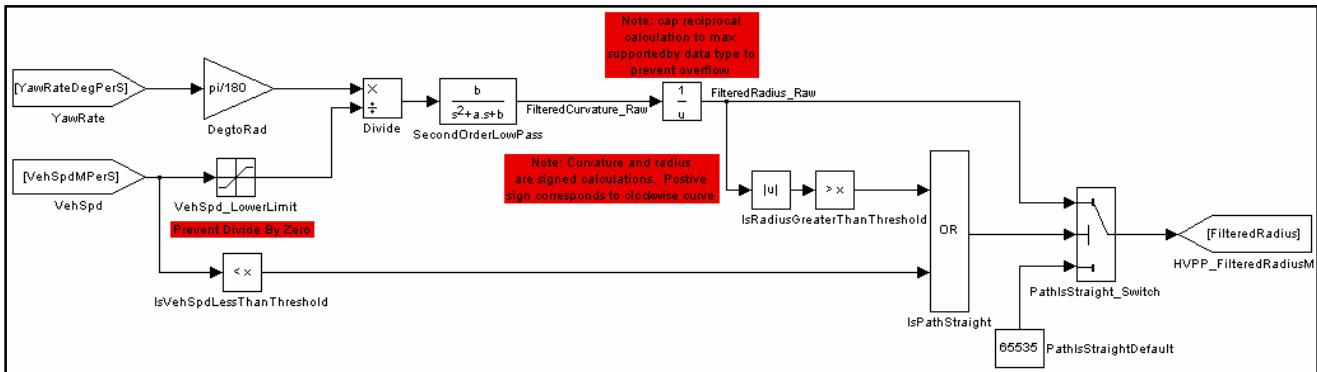

- curvature (1/m) = yaw rate (radians/s) / vehicle speed (m/s)

Upon calculation of the curvature, the signal is passed through a discretized second order low-pass filter (Figure 51) that has been calibrated to the appropriate cutoff frequency, damping factor, and sampling rate. Once the curvature calculation has been filtered, it is converted back to a radius in meters using the reciprocal. Special care must be taken to prevent overflow of the radius calculation when curvature is zero (or near zero). Radius calculations follow the SAE sign convention for rotation, where a positive sign represents a clockwise curvature about the vehicle boresight and a negative sign represents counter-clockwise.

A final set of logic checks two conditions to determine if the path should be considered “straight”:

- Vehicle speed is less than a calibrated threshold.
- Radius calculation is greater than a calibrated threshold.

If either of these conditions exists, the filtered radius output is set to a default value identified in J2735 [1] (32,767 m as of revision 35). Figure 52 shows the logic flow for the host vehicle path radius calculation:

**Figure 52 - Vehicle Path Radius Calculation**

#### A.6.4 Confidence Calculation

The preceding technique for calculating PP radii is highly effective when applied during “steady state” driving conditions; however, dynamic driving conditions can prove to be a challenge. Therefore a method must exist for identifying and communicating dynamic situations when path estimations may be largely inaccurate. Identifying “steady state” is accomplished by applying a confidence interval to a differentiated and filtered version of the yaw rate signal. The confidence indicator is calibrated to report low confidence when large changes in the vehicle yaw rate are detected over a short period of time. These conditions may include one or more of the following:

- Lane changes
- Curve entry and exit points
- Curve transitions
- Obstacle avoidance...and other highly dynamic driving situations

For the PP module, a second order low-pass filter with differentiator is used to identify that the vehicle is likely in “steady state” based steering input. The design is a discretized version of a standard second order unity-gain filter characterized by the following equations.

Discretized (unity-gain) second order low-pass filter with differentiator:

$$\frac{s\omega_0^2}{s^2 + 2\omega_0\zeta s + \omega_0^2} = \frac{\omega_0^2 T_s - \omega_0 T_s z^{-1}}{z^{-2} - (2+2\omega_0\zeta T_s)z^{-1} + (\omega_0^2 T_s^2 + 2\omega_0\zeta T_s + 1)}$$

Continuous (1/s = integrator)                                    Discrete (1/z = unit delay)

$$y_n = \frac{-y_{n-2} + (2+2\omega_0\zeta T_s)y_{n-1} + \omega_0^2 T_s u_n - \omega_0^2 T_s u_{n-1}}{(\omega_0^2 T_s^2 + 2\omega_0\zeta T_s + 1)}$$

(for n ≥ 3)

Initialization:  $y_1 = 0, y_2 = 0$

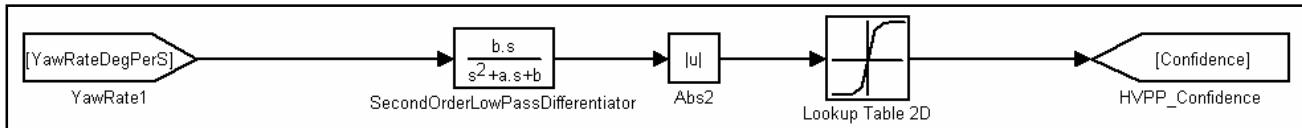

**Figure 53 - Discretized Second Order Low-Pass Filter with Differentiator**

Again,  $\omega_0 = 2\pi f_0$ ,  $f_0$  = cutoff frequency,  $\zeta$  = damping factor, and  $T_s$  = sampling time. Note:  $\zeta = 1$  (default) for a critically damped system.

In order for the PP module to provide the highest accuracy future path estimations, the vehicle must be at or near “steady state” conditions. Determining when the host vehicle is in “steady state” is accomplished by a second calculation using the yaw rate sensor input. The PP module monitors the rate of change of the host vehicle yaw rate to determine when “steady state” conditions are most likely to exist. This is accomplished using a discretized second order low-pass filter with differentiator (Figure 53). The confidence filter is tuned with a higher cutoff frequency in order for the indicator to lead the radius calculation during dynamic driving conditions. This ensures that the confidence indicator is capable of reporting changes in confidence prior to the change in radius output.

After filtering and differentiating the yaw rate, the output is applied to a tunable lookup table that provides confidence levels ranging from 0% to 100%.

Figure 54 shows the logic flow for the host vehicle “steady state” confidence calculation:

**Figure 54 - Vehicle Predicted Path Confidence Calculation**

#### A.6.5 Calibration

Table 23 below contains a list of the PP calibration parameters referenced throughout this standard along with their default, minimum, and maximum configurable parameters.

**Table 23 - PP Calibration Parameters**

Calibration Parameter	Description	Default Value	Minimum Value	Maximum Value	
Curvature Cutoff Frequency	Low-pass cutoff frequency for curvature filter	0.33 Hz	0.32 Hz	0.34 Hz	
Curvature Damping Factor	Curvature filter dampening factor	1	0	2	
Curvature Sampling Period	Sample time for discrete curvature filter	100 ms	100 ms	400 ms	
Minimum Vehicle Speed	Vehicle speed lower limit for curvature calculation	1 m/s	0 m/s (straight path only)	2 m/s	
Maximum Radius	Radius upper limit beyond which the path is considered "straight."	2,500 m	2,000 m	5,000 m	
Straight Path	When radius is greater than the maximum radius, the reported radius is set to this value to indicate a "straight" path. Based on J2735 reserved value for path prediction radius.	32,767	32,767	32,767	
Confidence Cutoff Frequency	Low-pass cutoff frequency for confidence filter	1 Hz	0.33 Hz	1 Hz	
Confidence Damping Factor	Confidence filter dampening factor	1	0	2	
Confidence Sampling Period	Sample time for discrete confidence filter	100 ms	100 ms	400 ms	
Confidence Values	Two-dimensional table accepts filtered/differentiated yaw rate and outputs a confidence from 0%–100%	See Table 24 for values			

**Table 24 - Confidence lookup table**

Input: Filtered/Differentiated Yaw Rate (degrees/s <sup>2</sup> )	25	20	15	10	5	2.5	2	1.5	1	0.5	0
Output: Confidence (%)	0	10	20	30	40	50	60	70	80	90	100

## A.7 OPEN SKY TEST CONDITIONS (NORMATIVE)

The designation “Open Sky” environment is intended to describe an environment in which there are minimal obstructions to the device’s view of the sky as used for testing in 0. Open Sky Test Conditions are defined, for the purposes of this standard, to be present when the following are all true:

- No view obstructions external to the vehicle can be seen, from the point of view of the GNSS antennas of reference device and device under test, starting from  $5^\circ$  above the horizontal plane (the elevation mask) containing the antenna phase center, in all directions around the antenna.
- The number of healthy satellites used, as reported by the reference device, for GPS satellites only, is greater than or equal to 7.
- The HDOP, as reported by the reference device, for GPS satellites, is less than or equal to 1.5, and VDOP is less than or equal to 3.

## A.8 ADDITIONAL CONGESTION CONTROL ALGORITHM DETAILS (NORMATIVE)

### A.8.1 Assumption of Latest HV State Information at RVs

For each BSM generated by the HV, use a Bernoulli trial with the channel quality indicator  $\Pi(k)$  to estimate whether the BSM was successfully received by the RVs.

- If the outcome of the Bernoulli trial is positive, assume that the BSM was successfully received by the RVs. Update the latest information assumed for the RVs with the state information contained in the BSM.
- Else, if the outcome of this Bernoulli trial is negative, assume the BSM transmission was not received by the RVs (TxFailed) and do not update the latest HV state information assumed for the RVs.
- If the Bernoulli trials result in more than  $vMaxSuccessiveFail$  consecutive negative outcomes, assume the most recent BSM transmission was successfully received by the RVs, and update the latest information assumed for the RVs with the state information contained in the most recent BSM.

Let  $\begin{bmatrix} t \\ x \\ y \\ v \\ \theta \end{bmatrix}_{\text{Latest}}$  be the HV's assumed latest state information received by RVs and  $\begin{bmatrix} t \\ x \\ y \\ v \\ \theta \end{bmatrix}_{\text{Pre-Tx}}$  be the HV's state information

contained in the message of its previous transmission (where  $t$  is the time in msec when the longitudinal position  $x$  (in degrees), lateral position  $y$  (in degrees), speed  $v$  (in m/s), and heading  $\theta(t)$  (in degrees) are measured. The HV's assumed latest state information received by RVs is updated after each transmission as follows:

```
If rand() <  $\Pi(k)$ 
  TxFailed = TxFailed + 1
Else
  TxFailed = 0
```

$$\begin{bmatrix} t \\ x \\ y \\ v \\ \theta \end{bmatrix}_{\text{Latest}} = \left\{ \begin{array}{l} \begin{bmatrix} t \\ x \\ y \\ v \\ \theta \end{bmatrix}_{\text{Pre-Tx}} \\ \quad \text{TxFailed} > 0 \text{ and } \text{TxFailed} \leq \text{vMaxSuccessiveFail} \\ \\ \begin{bmatrix} t \\ x \\ y \\ v \\ \theta \end{bmatrix}_{\text{Latest}} \\ \quad \text{otherwise set TxFailed} = 0 \end{array} \right\}$$

where `rand()` is a uniform random number generator with output between 0 and 1, and  $\Pi(k)$  is the estimated channel quality indicator.

Note that this only helps an HV predict whether or not the RVs received the HV's latest state information. The actual latest state information received by RVs might be different for each RV due to different scales of fading and packet collisions in the wireless channel and they might also be different from this HV's assumed latest state information received by RVs. The derived latest state information only serves as the "expected" state information perceived by an HV and is used to adapt its transmission rate.

#### A.8.2 Tracking Error

Calculate the tracking error as the distance between HV Local Estimate position  $(\hat{x}(k), (\hat{y}(k))$  and output of the HV Remote Estimate position,  $(\tilde{x}(k), \tilde{y}(k))$  using the great circle formula, i.e.,

$$e(k) = R(\hat{x}(k)) \times (\cos^{-1}(\sin(\hat{x}(k)) \times \sin(\tilde{x}(k)) + \cos(\hat{x}(k)) \times \cos(\tilde{x}(k)) \times \cos(\hat{y}(k) - \tilde{y}(k)))$$

where

$$R(\hat{x}(k)) = a \times (1 - f_1^2) / (1 - f_1^2 \times \sin^2(\hat{x}(k)))^{1.5}$$

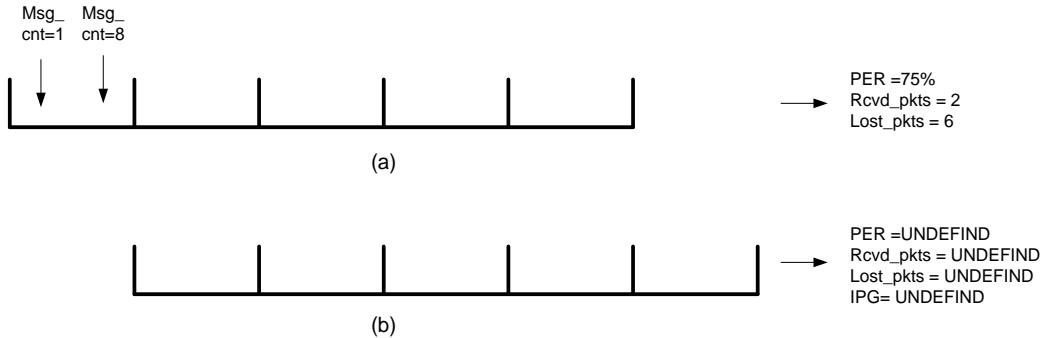

is the Meridian Radius of the Earth in meters, at latitude  $\hat{x}(k)$ ,  $a = 6378137$  is the mean radius of earth in meters,  $f_1 = (f \times (2 - f))^{0.5}$  is the Eccentricity, and  $f = 0.003353$  is earth's flattening.

Here  $(\hat{x}(k), \hat{y}(k))$  are the latitude and longitude from the HV Local Estimate, converted to radians, and  $(\tilde{x}(k), \tilde{y}(k))$  are the latitude and longitude from the HV Remote Estimate, converted to radians.

### A.8.3 PER Calculation Special Cases

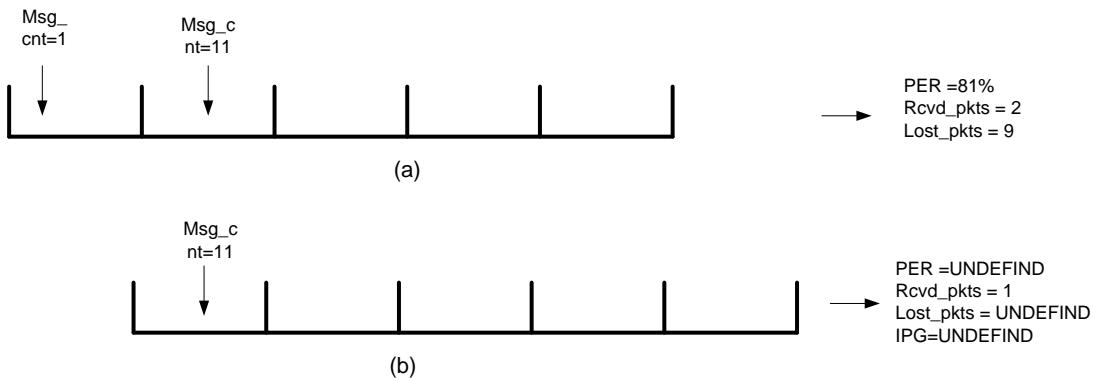

Assume that the *vPER/Interval* is divided into 5 subintervals as shown in Figure 55 and Figure 56. Some special cases should be considered during PER calculations as follows:

Figure 55 (a) shows that the node received 2 packets in the first subinterval (the arrows with msg\_cnt = 1 and msg\_cnt = 8 represent the received packets) and 0 packets in the remaining subintervals. The PER at the end of the subinterval is reported next to Figure 55 (a). Figure 55 (b) shows the status of the node after one sliding window. The PER is reported next to Figure 55 (b).

**Figure 55 - PER calculation example 1**

Figure 56 (a) shows that the node received 1 packet in the first subinterval (the arrow with msg\_cnt = 1) and another packet in the second subinterval (the arrow with msg\_cnt = 11) and 0 packets in the remaining subintervals. The PER at the end of this subinterval is reported next to Figure 56 (a). Figure 56 (b) shows the status of the node after one sliding window. The PER is reported next to Figure 56 (b).

**Figure 56 - PER calculation example 2**

#### A.9 EXAMPLE SIGNED MESSAGE WITH CERTIFICATE AND CORRESPONDING ASN.1 (INFORMATIVE)

Below is an example of a generic signed message with certificate and the corresponding ASN.1. The 1609.2 [3] profile in 6.1.2 was used to generate this sample. The payload of this security envelope (the message) is the ASCII text string “This is a BSM”.

#### A.10 REQUIREMENTS TRACEABILITY (NORMATIVE)

Figure 57 describes the traceability of the requirements in this Standard to the Scenarios defined for the Vehicle to Vehicle communications in Sections 4 and 5 of this Standard.

**Figure 57 - Traceability requirements of this standard**

The Scenario is the title of a scenario and reference paragraph defined in Section 4 of this standard. For example: EEBL – Lead Vehicle Decelerating (4.2.3), etc.

The Scenario Action is the specific action that applies or triggers the scenario(s). For example, RV-1 hard braking triggers the EEBL scenario (4.2.3).

The Physical Element (RV or HV) refers to the Subsystem(s) in Figure 1 that is the candidate(s) for implementing the function. When there is a Slash (“/”) mark, e.g., DSRC/ECU, it means the implementation could be in one or the other or both Subsystems.

The Standard Section number is the Section in this standard that contains the requirements for the scenario.

The Requirement Category corresponds to the requirements in Section 6.

Scenario	Scenario Action	Physical Element RV-1 (BSM Transmitter)	Standard Section (for the RV)	Requirement Category (for the RV)	Physical Element HV (BSM receiver)	Standard Section (for the HV)	Requirement Category (for the HV)
